The Number 1

Lemma 5 *The height of the cone can be calculated in terms of only r and θ*, thus θ is a function of β alone.

Proof. Since we have shown that $\theta r = 2\pi r - 2\pi r_1$ and $x = r_1 \to \sqrt{r^2 - \eta^2}$, we can substitute the expression for r_1, calculated from the Pythagorean theorem in terms of the height of the cone and the initial radius of the circle, into the expression for θr in terms of the change in circumference of the initial circle to the circle that is the base of the cone into which the circle was transformed.

$\theta r = 2\pi r - 2\pi\sqrt{(r\hat{}2 - \eta\hat{}2)}$, thus, $\eta = \frac{\sqrt{4\pi r^2\theta - r^2\theta^2}}{2\pi}$ = (r Sin[β]). From $\frac{2\pi\eta}{\sqrt{4\pi\theta - \theta^2}}$ = r, we note that: r = $\frac{2\pi r \,\text{Sin}[\beta]}{\sqrt{4\pi\theta - \theta^2}}$. So we solve the equation,

$$\text{Solve}\left[r == \frac{2\pi r\,\text{Sin}[\beta]}{\sqrt{4\pi\theta - \theta^2}}, \theta\right]$$

$$\left\{\left\{\theta \to 2\left(\pi - \sqrt{\pi^2 - \pi^2\,\text{Sin}[\beta]^2}\right)\right\}, \left\{\theta \to 2\left(\pi + \sqrt{\pi^2 - \pi^2\,\text{Sin}[\beta]^2}\right)\right\}\right\}$$

$$1 = \frac{2\pi\,\text{Sin}[\beta]}{\sqrt{4\pi\theta - \theta^2}}$$

$$r := \frac{2\,\pi\,\sqrt{(4\,\pi-\theta)\,\theta}}{(4\,\pi-\theta)\,\theta}$$

The Number 2

Theorem 1 *When a sector of angle θ is removed from a circle of radius r and the resulting shape is folded into a cone, then the base of the cone has radius* r_1 *given by* $r_1 = r - \frac{(r\,\theta)}{2\,\pi}$ *; and height η, given by* $\eta = \sqrt{r^2 - r_1^2}$ = r Sin[β]

Proof. The circumference of the initial circle is 2 π r and the wedge removed has an arc length r θ. Therefore, the remaining circumference is of length r (2 π - θ), and after the fold, this is the circumference of the base of the cone.

Establishing the circumference of the base of the cone, from the equation, $\theta\,r = 2\,\pi\,r - 2\,\pi\,r_1$, we calculate that its radius r_1 is $\frac{2\,\pi\,r - r\,\theta}{2\,\pi}$, which simplifies to $r - \frac{r\,\theta}{2\,\pi}$. Thus, we have proved the first part of the theorem.

To find the height of the cone, η, we apply the Pythagorean theorem to a right triangle formed between the apex of the cone, the center of the base, and a point on the circumference of the base. This gives $\eta = \sqrt{r^2 - r_1^2}$ = r Sin[β], where β is the angle formed by the slant of the cone and the base of the cone. The initial radius is always equal to the slant of the cone, and the height of the cone is always orthogonal to the center of the base of the cone.

11 Dimensional

Touching on the 11th dimension.

by Parker Emmerson © 2010

We start by examining the wavelength with constant value :

Theorem 4 : The derivative of the height of the cone with respect to time equals the average rate of the circumference of the initial circle divided by θ when $\theta = k\,t$ (the angle is a constant function of time like a clock).

velocity =

$$\text{wavelength of frequency} = v = \lambda f = r f = r/\tau = r\,(1/(\theta/(2\pi))) = \frac{2\pi r}{\theta} =$$

$$\frac{(2\pi r_1 + \theta r)}{\theta} = \frac{2\pi\theta r}{\theta\text{^}2} = \frac{2\pi s}{\theta^2} = \frac{2\pi\,\frac{(2\pi r - 2\pi r_1)}{\theta}}{\theta} = \frac{2\pi\,\frac{\left(2\pi r - 2\pi\sqrt{r^2-\eta^2}\right)}{\theta}}{\theta} = \quad (2)$$

$$\frac{2\pi\left(2\pi r - 2\pi\sqrt{r^2-\eta^2}\right)}{\theta^2} = \frac{2\pi\left(2\pi r - 2\pi\sqrt{r^2 - \left(\frac{\sqrt{4\pi r^2\theta - r^2\theta^2}}{2\pi}\right)^2}\right)}{\theta^2} =$$

$$(1/(1/(2\pi)))\,D\left[\frac{\sqrt{4\pi r^2\theta - r^2\theta^2}}{2\pi}, \theta\right] = \frac{4\pi r^2 - 2r^2\theta}{2\sqrt{4\pi r^2\theta - r^2\theta^2}}$$

Theorem 5 : The derivative of the height of the cone with respect to time equals the average rate of the circumference of the initial circle divided by θ when $\theta = k\,t$ (the angle is a constant function of time like a clock).

We Solve for r

$$\text{Solve}\left[\frac{2\pi\left(2\pi r - 2\pi\sqrt{r^2 - (\eta)^2}\right)}{\theta^2} == \frac{4\pi r^2 - 2 r^2 \theta}{2\sqrt{4\pi r^2 \theta - r^2 \theta^2}}, r\right]$$

$$\Big\{\Big\{r \to -\sqrt{\Big(-\left(256\,\pi^7\,\eta^2\,\theta^3\right) \big/ \left(-1024\,\pi^7\,\theta^3 + 1280\,\pi^6\,\theta^4 - 512\,\pi^5\,\theta^5 + 80\,\pi^4\,\theta^6 - 32\,\pi^3\,\theta^7 + 24\,\pi^2\,\theta^8 - 8\,\pi\,\theta^9 + \theta^{10}\right) + \left(320\,\pi^6\,\eta^2\,\theta^4\right) \big/ \left(-1024\,\pi^7\,\theta^3 + 1280\,\pi^6\,\theta^4 - 512\,\pi^5\,\theta^5 + 80\,\pi^4\,\theta^6 - 32\,\pi^3\,\theta^7 + 24\,\pi^2\,\theta^8 - 8\,\pi\,\theta^9 + \theta^{10}\right) - \left(128\,\pi^5\,\eta^2\,\theta^5\right) \big/ \left(-1024\,\pi^7\,\theta^3 + 1280\,\pi^6\,\theta^4 - 512\,\pi^5\,\theta^5 + 80\,\pi^4\,\theta^6 - 32\,\pi^3\,\theta^7 + 24\,\pi^2\,\theta^8 - 8\,\pi\,\theta^9 + \theta^{10}\right) + \left(16\,\pi^4\,\eta^2\,\theta^6\right) \big/ \left(-1024\,\pi^7\,\theta^3 + 1280\,\pi^6\,\theta^4 - 512\,\pi^5\,\theta^5 + 80\,\pi^4\,\theta^6 - 32\,\pi^3\,\theta^7 + 24\,\pi^2\,\theta^8 - 8\,\pi\,\theta^9 + \theta^{10}\right) - \left(128\,\pi^6\,\sqrt{\left(256\,\pi^5\,\eta^4\,\theta^3 - 448\,\pi^4\,\eta^4\,\theta^4 + 304\,\pi^3\,\eta^4\,\theta^5 - 100\,\pi^2\,\eta^4\,\theta^6 + 16\,\pi\,\eta^4\,\theta^7 - \eta^4\,\theta^8\right)}\right) \big/ \left(-1024\,\pi^7\,\theta^3 + 1280\,\pi^6\,\theta^4 - 512\,\pi^5\,\theta^5 + 80\,\pi^4\,\theta^6 - 32\,\pi^3\,\theta^7 + 24\,\pi^2\,\theta^8 - 8\,\pi\,\theta^9 + \theta^{10}\right)\Big)}\Big\},$$

Having composed the expression for $\frac{r^2}{\frac{\theta}{2\pi}}$ in the 11th dimension, we solve for the 11th dimensional position of theta. This takes two "runs through."

First run-through.

$$\text{Solve}\Big[\frac{r^2}{\frac{\theta}{2\pi}} == 2\pi\Big(-\left(256\pi^7\eta^2\theta^2\right)\Big/\left(-1024\pi^7\theta^3+1280\pi^6\theta^4-512\pi^5\theta^5+80\pi^4\theta^6-32\pi^3\theta^7+24\pi^2\theta^8-8\pi\theta^9+\theta^{10}\right)+\left(320\pi^6\eta^2\theta^3\right)\Big/\left(-1024\pi^7\theta^3+1280\pi^6\theta^4-512\pi^5\theta^5+80\pi^4\theta^6-32\pi^3\theta^7+24\pi^2\theta^8-8\pi\theta^9+\theta^{10}\right)-\left(128\pi^5\eta^2\theta^4\right)\Big/\left(-1024\pi^7\theta^3+1280\pi^6\theta^4-512\pi^5\theta^5+80\pi^4\theta^6-32\pi^3\theta^7+24\pi^2\theta^8-8\pi\theta^9+\theta^{10}\right)+\left(16\pi^4\eta^2\theta^5\right)\Big/\left(-1024\pi^7\theta^3+1280\pi^6\theta^4-512\pi^5\theta^5+80\pi^4\theta^6-32\pi^3\theta^7+24\pi^2\theta^8-8\pi\theta^9+\theta^{10}\right)+\left(128\pi^6\sqrt{\left(256\pi^5\eta^4\theta^3-448\pi^4\eta^4\theta^4+304\pi^3\eta^4\theta^5-100\pi^2\eta^4\theta^6+16\pi\eta^4\theta^7-\eta^4\theta^8\right)}\right)\Big/\left(-1024\pi^7\theta^4+1280\pi^6\theta^5-512\pi^5\theta^6+80\pi^4\theta^7-32\pi^3\theta^8+24\pi^2\theta^9-8\pi\theta^{10}+x\right)\Big), x\Big]$$

Eulerian

A Paper on Leonard Euler' s Formula in Natural Scientific Thought

To show that the ideas presented through the ontological cone (an analogy to the gestalt of perception through the sense of being), are applicable to the Euler equation is the purpose of this section.

$$e\hat{}(i\,\beta) = \text{Cos}[\beta] + i\,\text{Sin}[\beta]$$

$$e\hat{}(i\,\theta) = \text{Cos}[\theta] + i\,\text{Sin}[\theta]$$

If matter is composed of a geometric element in the shape of a cone, it may be purely geometrically stated that:

$$e^\wedge\left(i\,\text{ArcSin}\left[\frac{\sqrt{(4\pi-\theta)\,\theta}}{2\pi}\right]\right)==\left(\text{Cos}\left[\text{ArcSin}\left[\frac{\sqrt{(4\pi-\theta)\,\theta}}{2\pi}\right]\right]+i\,\text{Sin}\left[\text{ArcSin}\left[\frac{\sqrt{(4\pi-\theta)\,\theta}}{2\pi}\right]\right]\right)$$

$$e^{i\,\text{ArcSin}\left[\frac{\sqrt{(4\pi-\theta)\theta}}{2\pi}\right]}==\frac{i\sqrt{(4\pi-\theta)\,\theta}}{2\pi}+\sqrt{1-\frac{(4\pi-\theta)\,\theta}{4\pi^2}}$$

if it is within the region of $\theta=\pi$, $\beta=\frac{\pi}{2}$.

$$e^{i\,\text{ArcSin}\left[\frac{\sqrt{(4\pi-\theta)\theta}}{2\pi}\right]}==\frac{i\sqrt{(4\pi-\theta)\,\theta}}{2\pi}+\sqrt{1-\frac{(4\pi-\theta)\,\theta}{4\pi^2}}=\frac{i\sqrt{(4\pi-\theta)\,\theta}}{2\pi}+\sqrt{1-\frac{u^2}{c^2}}$$

$$\text{Solve}\left[\sqrt{1-\frac{(4\pi-\theta)\,\theta}{4\pi^2}} == \frac{i\sqrt{(4\pi-\theta)\,\theta}}{2\pi}+\sqrt{1-\frac{u^2}{c^2}},\ u\right]$$

A Unifying Theory

Parker Emmerson and Andrew Berisha

c = 3.0 * 10 ^ 8 m / s

$C = 2\pi r$

This is the circumference of our initial circle of radius r

$C_2 = 2\pi r_1$

This is the circumference of our second circle,
the base of the cone, of radius r_1

$r^2 = r_1^2 + h^2$

This is the initial radius squared expressed as the slant of
the cone in terms of the height of the cone, h, and the radius
of the base of the cone, r_1

$$r = \sqrt{(r_1^2 + h^2)} \quad (4)$$

$t = \theta r$

$t / \theta = r$

The arc length taken out of a circle at a given time is =

$t = C - C_2 = 2\pi r - 2\pi r_1 = \theta r$ → Equation 7

$r_1^2 == r^2 - h^2$

$r_1 = \sqrt{(r^2 - h^2)}$

$h \le r$

τ = time

1 second = 6 degrees

πr^2 = Area = h^2

To construct a square of the same area as a given circle, we will begin with the postulates above regarding the geometry of a cone.

When, "relationship is added to non relational stimuli" (Perception, MacLeod and Pick for Gibson, 24), illusion is able to be understood through phenomenology. We can use mathematics like a language for disussing its structural elements.

The derivative of zero is equal to the derivative of an equation that is equal to 0.

```
Solve[r₁^2 + h^2 == r^2, h]
```

$$\left\{\left\{h \to -\sqrt{r^2 - r_1^2}\right\}, \left\{h \to \sqrt{r^2 - r_1^2}\right\}\right\} \quad (5)$$

$(t / \theta) = r$

$t = C - C_2 = 2\pi r - 2\pi r_1 = 2\pi\ (t / \theta) - 2\pi \sqrt{((t / \theta)^2 - h^2)}$

$t == 2\pi\ (t / \theta) - 2\pi \sqrt{((t / \theta)^2 - h^2)}$

Add $2\pi\sqrt{((r)^2 - h^2)}$ to both sides

$t + 2\pi\sqrt{((t/\theta)^2 - h^2)} = 2\pi\,(t/\theta)$

Subtract t from both sides and remember that $(t/\theta) = r$

$2\pi\sqrt{((t/\theta)^2 - (h^2))} = 2\pi\,(t/\theta) - t = 2\pi r - t$

Divide by 2π on both sides.

$(t/\theta) - t/(2\pi) = (r) - t/(2\pi) = \sqrt{((t/\theta)^2 - (h^2))} = \sqrt{((r)^2 - (h^2))} = r_1$

Square both sides. Substitute : $(t/\theta) = r$

$((t/\theta) - (t/(2\pi)))^2 = ((r) - (t/(2\pi)))^2 = ((t/\theta)^2 - (h^2)) = (r_1^2)$

$((r) - (t/(2\pi)))^2 = ((r)^2 - (h^2))$

Add h^2 to both sides.

$((r) - (t/(2\pi)))^2 + (h^2) = (r)^2$

Substitute : $\theta r = t$

$((t/\theta) - (t/(2\pi)))^2 = ((r) - (\theta * r/(2\pi)))^2$

$((r) - (\theta * r/(2\pi)))^2$

$$\left(r - \frac{r\theta}{2\pi}\right)^2$$

$$\text{Expand}\left[\left(r - \frac{r\theta}{2\pi}\right)^2\right]$$

$$r^2 - \frac{r^2\theta}{\pi} + \frac{r^2\theta^2}{4\pi^2}$$

$$r^2 - \frac{r^2\theta}{\pi} + \frac{r^2\theta^2}{4\pi^2} + h^2 = ((r) - (t/2\pi))^2 + (h^2) = r^2$$

$$(r^2) - \left(r^2 - \frac{r^2\theta}{\pi} + \frac{r^2\theta^2}{4\pi^2}\right) = h^2$$

$$\text{Simplify}\left[(r^2) - \left(r^2 - \frac{r^2\theta}{\pi} + \frac{r^2\theta^2}{4\pi^2}\right)\right]$$

$$\frac{r^2\,(4\pi - \theta)\,\theta}{4\pi^2} = h^2 \tag{6}$$

$$\frac{2h\pi}{\sqrt{4\pi\theta - \theta^2}} = r \tag{7}$$

$$\frac{2\,(r/6\theta)\,(6\theta))\,\pi}{\sqrt{4\pi\theta - \theta^2}} = r = \frac{2r\pi}{\sqrt{4\pi\theta - \theta^2}} \tag{8}$$

$$1 = \frac{2\pi}{\sqrt{4\pi\theta - \theta^2}}$$

This is the equation for r_1 in terms of the geometric parameters of the cone described above.

$\pi\,(r\text{^}2 - h\text{^}2) == \pi\, r_1\text{^}2$

Then, we substitute for the solved height in terms of purely theta and radius.

Done just with

$$\text{Solve}\left[\pi\left(r\text{^}2 - \left(\frac{r^2\,(4\,\pi - \theta)\,\theta}{4\,\pi^2}\right)\right) == \pi\left(r\text{^}2 - \left(\frac{r^2\,(4\,\pi - \theta)\,\theta}{4\,\pi^2}\right)\right)\text{^}2,\ r\right]$$

$$\left\{\{r \to 0\},\ \{r \to 0\},\ \left\{r \to -\frac{2\,\pi\,\sqrt{4\,\pi^2 - 4\,\pi\,\theta + \theta^2}}{\sqrt{16\,\pi^4 - 32\,\pi^3\,\theta + 24\,\pi^2\,\theta^2 - 8\,\pi\,\theta^3 + \theta^4}}\right\},\ \left\{r \to \frac{2\,\pi\,\sqrt{4\,\pi^2 - 4\,\pi\,\theta + \theta^2}}{\sqrt{16\,\pi^4 - 32\,\pi^3\,\theta + 24\,\pi^2\,\theta^2 - 8\,\pi\,\theta^3 + \theta^4}}\right\}\right\} \tag{9}$$

Remember when we said that $\pi\,(r\text{^}2 - h\text{^}2) == \pi\, r_1\text{^}2$.

When is the area of $h\text{^}2$ equal to the area of the circle of r_1?

Well, what if $h\text{^}2 = \pi\, r_1\text{^}2 = \pi\left(r\text{^}2 - \left(\frac{r^2\,(4\,\pi - \theta)\,\theta}{4\,\pi^2}\right)\right)$

$$\pi\, r_1\text{^}2 = \pi\left(r\text{^}2 - \left(\frac{r^2\,(4\,\pi - \theta)\,\theta}{4\,\pi^2}\right)\right)\text{^}2 = \left(\frac{r^2\,(4\,\pi - \theta)\,\theta}{4\,\pi^2}\right)$$

$$\text{Solve}\left[\pi\left(r\text{^}2 - \left(\frac{r^2\,(4\,\pi - \theta)\,\theta}{4\,\pi^2}\right)\right)\text{^}2 == \left(\frac{r^2\,(4\,\pi - \theta)\,\theta}{4\,\pi^2}\right),\ r\right]$$

$$\left\{\{r \to 0\},\ \{r \to 0\},\ \left\{r \to -\frac{2\,\sqrt{\pi}\,\sqrt{4\,\pi\,\theta - \theta^2}}{\sqrt{16\,\pi^4 - 32\,\pi^3\,\theta + 24\,\pi^2\,\theta^2 - 8\,\pi\,\theta^3 + \theta^4}}\right\},\ \left\{r \to \frac{2\,\sqrt{\pi}\,\sqrt{4\,\pi\,\theta - \theta^2}}{\sqrt{16\,\pi^4 - 32\,\pi^3\,\theta + 24\,\pi^2\,\theta^2 - 8\,\pi\,\theta^3 + \theta^4}}\right\}\right\} \tag{10}$$

We will now elaborate on the nature of r_1 in terms of constant rate, and then come back to the equations for r that we have found through the realization of its parameters and solve them for theta.

$$r_1\text{^}2 = \left(r\text{^}2 - \left(\frac{r^2\,(4\,\pi - \theta)\,\theta}{4\,\pi^2}\right)\text{^}2\right) = r\text{^}2 - h\text{^}2$$

$$r_1 = \sqrt{(r^\wedge 2 - h^\wedge 2)} = \sqrt{\left(\left(\frac{2\sqrt{\pi}\ \sqrt{4\pi\theta-\theta^2}}{\sqrt{16\pi^4-32\pi^3\theta+24\pi^2\theta^2-8\pi\theta^3+\theta^4}}\right)^\wedge 2 - \left(\frac{r^2\ (4\pi-\theta)\ \theta}{4\pi^2}\right)\right)} =$$

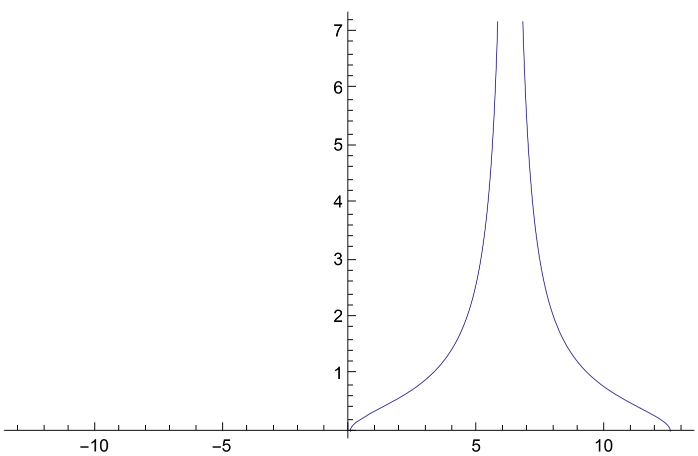
$$\sqrt{\left(\left(\frac{2\sqrt{\pi}\ \sqrt{4\pi\theta-\theta^2}}{\sqrt{16\pi^4-32\pi^3\theta+24\pi^2\theta^2-8\pi\theta^3+\theta^4}}\right)^\wedge 2 - \left(\frac{\left(-\frac{2\sqrt{\pi}\ \sqrt{4\pi\theta-\theta^2}}{\sqrt{16\pi^4-32\pi^3\theta+24\pi^2\theta^2-8\pi\theta^3+\theta^4}}\right)^2 (4\pi-\theta)\ \theta}{4\pi^2}\right)\right)} =$$

$$\sqrt{\left(\left(\frac{2\sqrt{\pi}\ \sqrt{4\pi\theta-\theta^2}}{\sqrt{16\pi^4-32\pi^3\theta+24\pi^2\theta^2-8\pi\theta^3+\theta^4}}\right)^\wedge 2 - \left(\frac{\left(\frac{2\sqrt{\pi}\ \sqrt{4\pi\theta-\theta^2}}{\sqrt{16\pi^4-32\pi^3\theta+24\pi^2\theta^2-8\pi\theta^3+\theta^4}}\right)^2 (4\pi-\theta)\ \theta}{4\pi^2}\right)\right)}$$

Plot[

$$\sqrt{\left(\left(\frac{2\sqrt{\pi}\ \sqrt{4\pi\theta-\theta^2}}{\sqrt{16\pi^4-32\pi^3\theta+24\pi^2\theta^2-8\pi\theta^3+\theta^4}}\right)^\wedge 2 - \left(\frac{\left(-\frac{2\sqrt{\pi}\ \sqrt{4\pi\theta-\theta^2}}{\sqrt{16\pi^4-32\pi^3\theta+24\pi^2\theta^2-8\pi\theta^3+\theta^4}}\right)^2 (4\pi-\theta)\ \theta}{4\pi^2}\right)\right)},$$

{θ, -13, 13}]



We will briefly show what the graph looks like when the speed of light is the constant rate at which h is traveling, not h = c6θ = (r / 6 θ) (6 θ). In that case, r would equal h, but what about the fact that h changes through r_1 (the base of the cone)? We

will instead propose to say that h travels not at any rate, but at the speed of light. Of course, it's also possible to theorize and propose that the cone travels up into the third dimension, h, at a rate equal to the first derivative of the equation for r in terms of theta with respect to theta. However, we will now briefly discuss what happens to r_1 when the cone travels

$$\frac{r^2 (4\pi - \theta)\,\theta}{4\pi^2} = h\text{^}2;\quad \frac{2 h \pi}{\sqrt{4\pi\theta - \theta^2}} = r$$

$$\text{Simplify}\left[\sqrt{\frac{r^2 (4\pi - \theta)\,\theta}{4\pi^2}}\right]$$

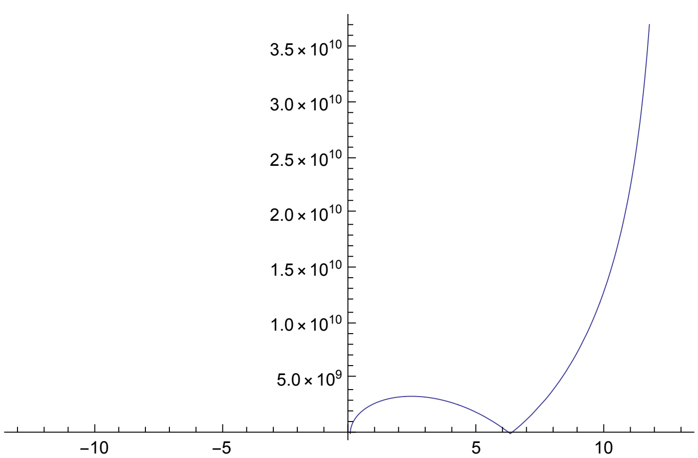
$$\frac{\sqrt{r^2 (4\pi - \theta)\,\theta}}{2\pi}$$

For light, the equation would read:

$$r_1 = \sqrt{\left(\left(\frac{2\,(2.99792 * 10\text{^}8)\,(6)\,(\theta)\,\pi}{\sqrt{4\pi\theta - \theta^2}}\right)\text{^}2 - \left(\frac{\sqrt{\left(\frac{2\,(2.99792*10\text{^}8)\,(6)\,(\theta)\,\pi}{\sqrt{4\pi\theta-\theta^2}}\right)^2 (4\pi - \theta)\,\theta}}{2\pi}\right)\text{^}2\right)}$$

$$\sqrt{\frac{1.27733\times 10^{20}\,\theta^2}{4\pi\theta - \theta^2} - \frac{3.23551\times 10^{18}\,(4\pi - \theta)\,\theta^3}{4\pi\theta - \theta^2}}$$

$$\text{Plot}\left[\sqrt{\frac{1.2773276589129854\text{`}*\text{^}20\,\theta^2}{4\pi\theta - \theta^2} - \frac{3.235508757504\text{`}*\text{^}18\,(4\pi - \theta)\,\theta^3}{4\pi\theta - \theta^2}},\ \{\theta, -13, 13\}\right]$$



This is something much different from the quality of matter whose energetic relation to velocity is defined within its own consistency.

Now we will return to the more general form of the equation. The case when h = (r/6 θ) (6 θ)

Now, by doing the first and second derivatives of the functions for radius in terms of the square of h being equal to the are of the cirle of r_1 with respect to time will give us velocity.

$$\left\{r \to -\frac{2\sqrt{\pi}\sqrt{4\pi\theta-\theta^2}}{\sqrt{16\pi^4-32\pi^3\theta+24\pi^2\theta^2-8\pi\theta^3+\theta^4}}\right\},\ \left\{r \to \frac{2\sqrt{\pi}\sqrt{4\pi\theta-\theta^2}}{\sqrt{16\pi^4-32\pi^3\theta+24\pi^2\theta^2-8\pi\theta^3+\theta^4}}\right\}$$

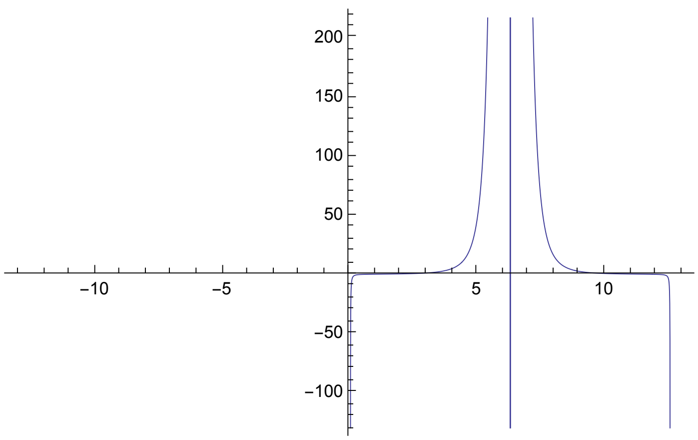
$$\frac{2\sqrt{\pi}}{\sqrt{4\pi\theta - \theta^2}\ \sqrt{16\pi^4 - 32\pi^3\theta + 24\pi^2\theta^2 - 8\pi\theta^3 + \theta^4}},\ \{\theta, -13, 13\}\Big]$$



In the following graph, we will zoom in to show that there is possibly a solution for theta , which is the Golden Ratio.

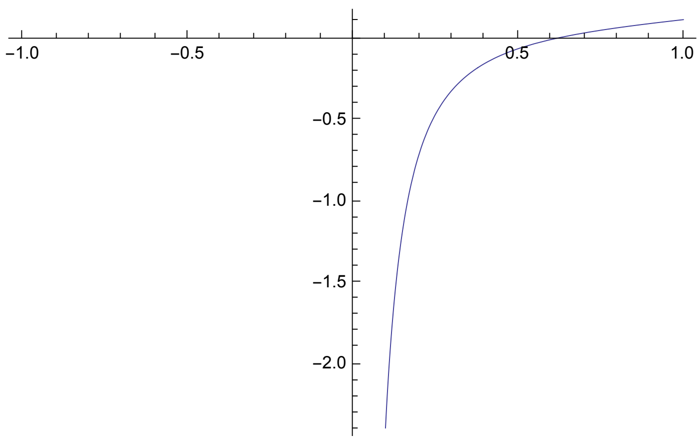
$$\text{Plot}\Big[\frac{3\sqrt{\pi}\ \sqrt{4\pi\theta-\theta^2}\ \left(-32\pi^3+48\pi^2\theta-24\pi\theta^2+4\theta^3\right)^2}{2\left(16\pi^4-32\pi^3\theta+24\pi^2\theta^2-8\pi\theta^3+\theta^4\right)^{5/2}}-$$

$$\frac{\sqrt{\pi}\ \sqrt{4\pi\theta-\theta^2}\ \left(48\pi^2-48\pi\theta+12\theta^2\right)}{\left(16\pi^4-32\pi^3\theta+24\pi^2\theta^2-8\pi\theta^3+\theta^4\right)^{3/2}}-$$

$$\frac{\sqrt{\pi}\ (4\pi-2\theta)\ \left(-32\pi^3+48\pi^2\theta-24\pi\theta^2+4\theta^3\right)}{\sqrt{4\pi\theta-\theta^2}\ \left(16\pi^4-32\pi^3\theta+24\pi^2\theta^2-8\pi\theta^3+\theta^4\right)^{3/2}}-$$

$$\frac{\sqrt{\pi}\ (4\pi-2\theta)^2}{2\left(4\pi\theta-\theta^2\right)^{3/2}\ \sqrt{16\pi^4-32\pi^3\theta+24\pi^2\theta^2-8\pi\theta^3+\theta^4}}-$$

$$\frac{2\sqrt{\pi}}{\sqrt{4\pi\theta-\theta^2}\ \sqrt{16\pi^4-32\pi^3\theta+24\pi^2\theta^2-8\pi\theta^3+\theta^4}},\ \{\theta,-1,1\}\Big]$$



There is a gap at the Golden ratio, and we can show this by saying :

That, for instance, when considering the above equation and graph, we note that :

$$\text{when a = 0 = } \frac{3\sqrt{\pi}\sqrt{4\pi\theta-\theta^2}\left(-32\pi^3+48\pi^2\theta-24\pi\theta^2+4\theta^3\right)^2}{2\left(16\pi^4-32\pi^3\theta+24\pi^2\theta^2-8\pi\theta^3+\theta^4\right)^{5/2}} - \frac{\sqrt{\pi}\sqrt{4\pi\theta-\theta^2}\left(48\pi^2-48\pi\theta+12\theta^2\right)}{\left(16\pi^4-32\pi^3\theta+24\pi^2\theta^2-8\pi\theta^3+\theta^4\right)^{3/2}} - \frac{\sqrt{\pi}(4\pi-2\theta)\left(-32\pi^3+48\pi^2\theta-24\pi\theta^2+4\theta^3\right)}{\sqrt{4\pi\theta-\theta^2}\left(16\pi^4-32\pi^3\theta+24\pi^2\theta^2-8\pi\theta^3+\theta^4\right)^{3/2}} - \frac{\sqrt{\pi}(4\pi-2\theta)^2}{2\left(4\pi\theta-\theta^2\right)^{3/2}\sqrt{16\pi^4-32\pi^3\theta+24\pi^2\theta^2-8\pi\theta^3+\theta^4}} - \frac{2\sqrt{\pi}}{\sqrt{4\pi\theta-\theta^2}\sqrt{16\pi^4-32\pi^3\theta+24\pi^2\theta^2-8\pi\theta^3+\theta^4}}$$

$$\text{Solve}\left[0 == \frac{3\sqrt{\pi}\sqrt{4\pi\theta-\theta^2}\left(-32\pi^3+48\pi^2\theta-24\pi\theta^2+4\theta^3\right)^2}{2\left(16\pi^4-32\pi^3\theta+24\pi^2\theta^2-8\pi\theta^3+\theta^4\right)^{5/2}} - \frac{\sqrt{\pi}\sqrt{4\pi\theta-\theta^2}\left(48\pi^2-48\pi\theta+12\theta^2\right)}{\left(16\pi^4-32\pi^3\theta+24\pi^2\theta^2-8\pi\theta^3+\theta^4\right)^{3/2}} - \frac{\sqrt{\pi}(4\pi-2\theta)\left(-32\pi^3+48\pi^2\theta-24\pi\theta^2+4\theta^3\right)}{\sqrt{4\pi\theta-\theta^2}\left(16\pi^4-32\pi^3\theta+24\pi^2\theta^2-8\pi\theta^3+\theta^4\right)^{3/2}} - \frac{\sqrt{\pi}(4\pi-2\theta)^2}{2\left(4\pi\theta-\theta^2\right)^{3/2}\sqrt{16\pi^4-32\pi^3\theta+24\pi^2\theta^2-8\pi\theta^3+\theta^4}} - \frac{2\sqrt{\pi}}{\sqrt{4\pi\theta-\theta^2}\sqrt{16\pi^4-32\pi^3\theta+24\pi^2\theta^2-8\pi\theta^3+\theta^4}}, \theta\right]$$

$$\left\{\left\{\theta\to 2\pi-\sqrt{9-\sqrt{33}}\,\pi\right\}, \left\{\theta\to 2\pi+\sqrt{9-\sqrt{33}}\,\pi\right\}, \left\{\theta\to 2\pi-\sqrt{9+\sqrt{33}}\,\pi\right\}, \left\{\theta\to 2\pi+\sqrt{9+\sqrt{33}}\,\pi\right\}\right\}$$

The following solutions for theta come from :

$$\text{Solve}\left[\pi\left(r\wedge 2-\left(\frac{r^2(4\pi-\theta)\theta}{4\pi^2}\right)\right)\wedge 2 == \left(\frac{r^2(4\pi-\theta)\theta}{4\pi^2}\right), \theta\right]$$

$$\left\{\left\{\theta\to\frac{2\pi r^2-\sqrt{2\pi}\sqrt{-r^2-r^2\sqrt{1+4\pi r^2}}}{r^2}\right\}, \left\{\theta\to\frac{2\pi r^2+\sqrt{2\pi}\sqrt{-r^2-r^2\sqrt{1+4\pi r^2}}}{r^2}\right\},\right.$$

(44)

$$\left\{\theta \to \frac{2\pi r^2 - \sqrt{2\pi}\ \sqrt{-r^2 + r^2\ \sqrt{1 + 4\pi r^2}}}{r^2}\right\},$$

$$\left\{\theta \to \frac{2\pi r^2 + \sqrt{2\pi}\ \sqrt{-r^2 + r^2\ \sqrt{1 + 4\pi r^2}}}{r^2}\right\}\}$$

This frequency comes from :

$$r = \frac{2\ (3.0 * 10\wedge 8)\ (6)\ (\theta)\ \pi}{\sqrt{4\pi\theta - \theta^2}} = \lambda = \frac{2\ \sqrt{\pi}\ \sqrt{4\pi\theta - \theta^2}}{\sqrt{16\pi^4 - 32\pi^3\theta + 24\pi^2\theta^2 - 8\pi\theta^3 + \theta^4}} \tag{15}$$

$$\mathbf{r = \frac{2\,h\,\pi}{\sqrt{4\pi\theta - \theta^2}} = \frac{2\ (c)\ (6)\ (\theta)\ \pi}{\sqrt{4\pi\theta - \theta^2}} == \frac{2\ (r\ /\ t)\ (6)\ (\theta)\ \pi}{\sqrt{4\pi\theta - \theta^2}} == \frac{2\ (r\ /\ (6\,\theta))\ (6)\ (\theta)\ \pi}{\sqrt{4\pi\theta - \theta^2}} = \frac{2\ \sqrt{\pi}\ \sqrt{4\pi\theta - \theta^2}}{\sqrt{16\pi^4 - 32\pi^3\theta + 24\pi^2\theta^2 - 8\pi\theta^3 + \theta^4}}}$$

Where c is the speed of light.

$$\mathbf{Solve\left[\frac{2\ \sqrt{\pi}\ \sqrt{4\pi\theta - \theta^2}}{\sqrt{16\pi^4 - 32\pi^3\theta + 24\pi^2\theta^2 - 8\pi\theta^3 + \theta^4}} == \frac{2\ (r\ /\ (6\,\theta))\ (6)\ (\theta)\ \pi}{\sqrt{4\pi\theta - \theta^2}},\ \theta\right]}$$

$$\left\{\left\{\theta \to \frac{2\left(-\pi + \pi^{3/2}\ r - \sqrt{\pi^2 - \pi^{5/2}\ r}\right)}{-1 + \sqrt{\pi}\ r}\right\}, \left\{\theta \to \frac{2\left(-\pi + \pi^{3/2}\ r + \sqrt{\pi^2 - \pi^{5/2}\ r}\right)}{-1 + \sqrt{\pi}\ r}\right\},\right.$$

$$\left.\left\{\theta \to \frac{2\left(\pi + \pi^{3/2}\ r - \sqrt{\pi^2 + \pi^{5/2}\ r}\right)}{1 + \sqrt{\pi}\ r}\right\}, \left\{\theta \to \frac{2\left(\pi + \pi^{3/2}\ r + \sqrt{\pi^2 + \pi^{5/2}\ r}\right)}{1 + \sqrt{\pi}\ r}\right\}\right\}$$

$$\mathbf{Solve\left[\frac{2\ (r\ /\ (6\,\theta))\ (6)\ (\theta)\ \pi}{\sqrt{4\pi\theta - \theta^2}} == r,\ \theta\right]}$$

$$\{\{\theta \to 2\pi\}\}$$

The age of a negative mitichlorian.

(See the Geometric Patterns of Perception Series for more in depth solutions (explainations, system of variables and postulates))

E = hnf=hν, where h is Planck' s constant, not the height of the cone.

$$\mathbf{r\ /\ t = r\ /\ (6\,\theta) = c = \lambda f = r\ (1\ /\ 6\,\theta)}$$

r/t is the rate of travel for the wave and is related to the speed of light. The speed of light is variable.

$$\mathbf{Solve\left[(r\ /\ t) == \frac{(r\ /\ t)\ 6\ (\theta)\ \pi}{\sqrt{4\pi\theta - \theta^2}} * \nu,\ \nu\right]}$$

$$\left\{\left\{\nu \to \frac{\sqrt{(4\pi - \theta)\ \theta}}{6\pi\theta}\right\}\right\} \tag{16}$$

$$\text{Solve}\left[n\ (1/6\,\theta) == \frac{\sqrt{(4\pi-\theta)\,\theta}}{6\pi\theta}, n\right]$$

$$\left\{\left\{n \to \frac{\sqrt{(4\pi-\theta)\,\theta}}{\pi\,\theta^2}\right\}\right\} \quad (17)$$

Where h is Planck ' s Constant, n the number of moles, and f the frequency, we may say that the force of dark matter (F_{dm}) is capable of being solved for in terms of time or purely space.

$$D[hnf, \theta] = (F_{dm})$$

$$D\left[(6.62606896 * 10\text{^}-34)\ \frac{\sqrt{(4\pi-\theta)\,\theta}}{\pi\,\theta^2}\ \frac{\sqrt{(4\pi-\theta)\,\theta}}{6\pi\theta}, \theta\right] = (F_{dm}) = m\,a$$

$$D\left[(6.62606896 * 10\text{^}-34)\ \frac{\sqrt{(4\pi-\theta)\,\theta}}{\pi\,\theta^2}\ \frac{\sqrt{(4\pi-\theta)\,\theta}}{6\pi\theta}, \theta\right]$$

$$-\frac{2.2378704997431808\text{`}*\text{^}-35\ (4\pi-\theta)}{\theta^3} - \frac{1.1189352498715904\text{`}*\text{^}-35}{\theta^2} =$$

$$(F_{dm}) = ma = m\left(\frac{3\sqrt{\pi}\ \sqrt{4\pi\theta-\theta^2}\ \left(-32\pi^3+48\pi^2\theta-24\pi\theta^2+4\theta^3\right)^2}{2\left(16\pi^4-32\pi^3\theta+24\pi^2\theta^2-8\pi\theta^3+\theta^4\right)^{5/2}} - \right.$$

Remember that this solution is only for one of the possibilities for theta and r put together. There are other valid solutions that may work parametrically. Approximating these by their derivative functions relates to the uncertainty of their position to a more simplified structure for solutions. Now we'll find Planck's constant in terms of the S.I. units.

h = ((m r^2) / (6 θ)^2) (6 θ) = (m r^2) / (6 θ)

E = hnf = hν

$$E = hnf = (m r^2) / (6 \theta) \nu = (m r^2) / (6 \theta) \frac{\sqrt{(4\pi - \theta)\theta}}{\pi \theta^2} \frac{\sqrt{(4\pi - \theta)\theta}}{6 \pi \theta} = hnf$$

$$(m r^2) / (6 \theta) \frac{\sqrt{(4\pi - \theta)\theta}}{\pi \theta^2} \frac{\sqrt{(4\pi - \theta)\theta}}{6 \pi \theta} = hnf$$

This is the acceleration due to gravity of dark matter.

$$g = -(mG / d^2) \hat{r}$$

For $\hat{r}$, we will say that it is any distance with a max of r. Before, we defined h to be the height of a cone and then changed our definition of the variable h to be Planck ' s constant. We are now redefining again for h to say that it is the height of the cone once again.

$$\text{Solve}\left[\frac{r^2 (4\pi - \theta)\theta}{4\pi^2} == h^2,\ h\right]$$

$$\left\{\left\{\eta = h \to -\frac{\sqrt{4\pi r^2 \theta - r^2 \theta^2}}{2\pi}\right\}, \left\{\eta = h \to \frac{\sqrt{4\pi r^2 \theta - r^2 \theta^2}}{2\pi}\right\}\right\}$$

Final redefinition :

h := Planck' s Constant

$$d = r$$

$$g = -(mG / r^2) \hat{r} = -(mG / \eta^2) = \tag{18}$$

The big G is the universal gravitational constant, which we will now take out the numerical constant part of it, and replace its units with variables.

The object is taken up by the sphere with radius r_1. η is the distance away from the center of the other gravitational object. This shows that the radius, r_1 refers to an expanding object when gravity accelerates objects through spacetime. This is why the universe is expanding.

E = h ν, where E is energy, h is Planck ' s Constant, and ν is frequency. (19)

E = ℏ ω, where E is energy, h - bar is h / 2 π, and omega is angular frequency. (20)

v = λ ν, where v is velocity, λ is wavelength, and f is frequency. (21)

E = m c^2, where E is energy, m is mass, and c is the speed of light. (22)

The First r and θ solutions will be discussed now.

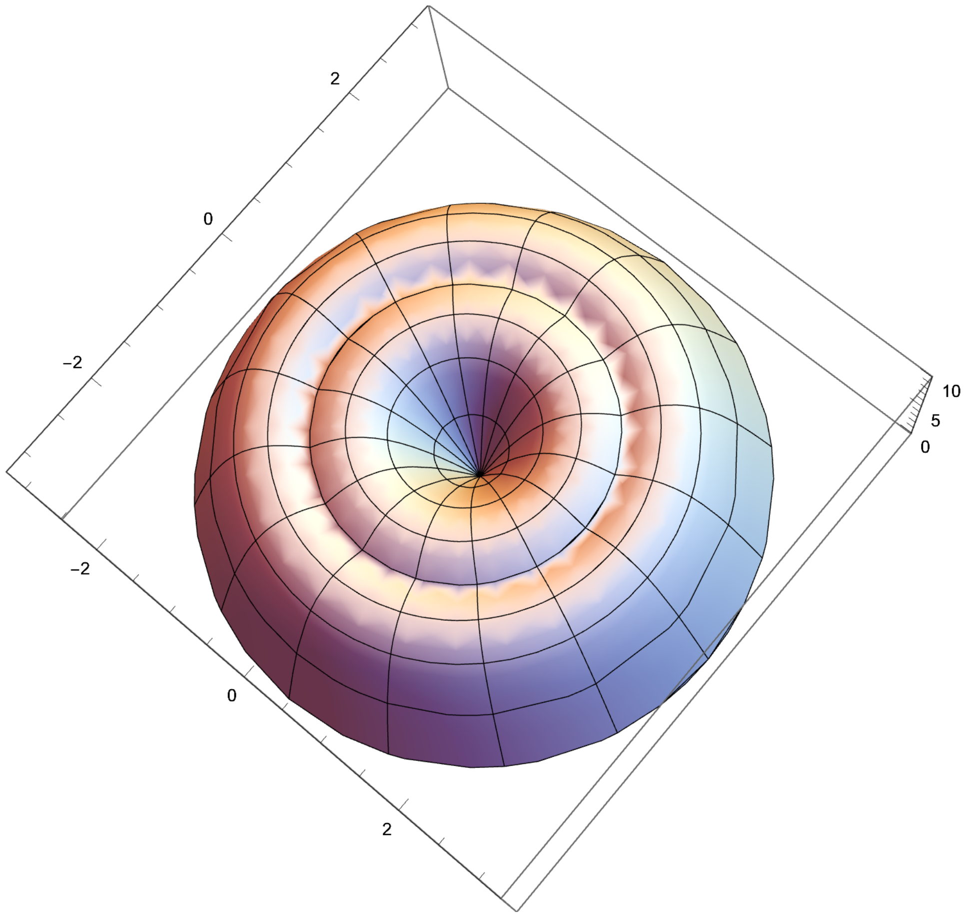
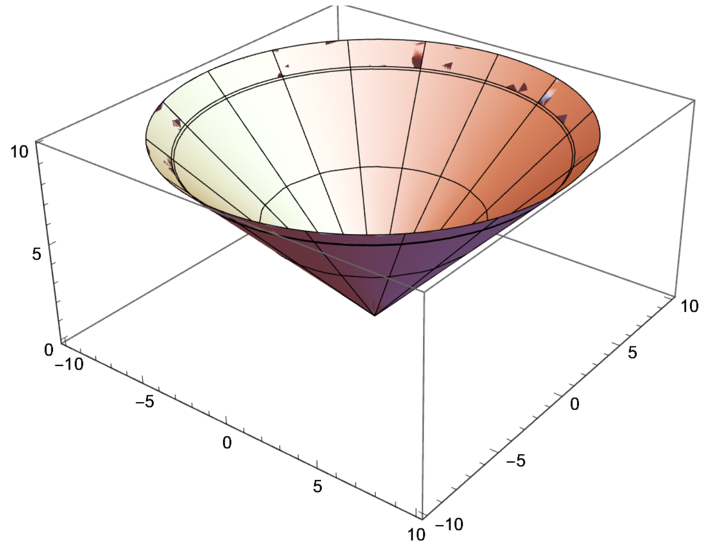
$$\text{RevolutionPlot3D}\left[2\sqrt{3\pi^2\,\text{Sin}[\beta]^2-\pi^2\,\text{Sin}[\beta]^4+2\,\pi^2\,\text{Sin}[\beta]^2\,\sqrt{1-\text{Sin}[\beta]^2}},\ \{\beta,-\pi,\pi\}\right]$$

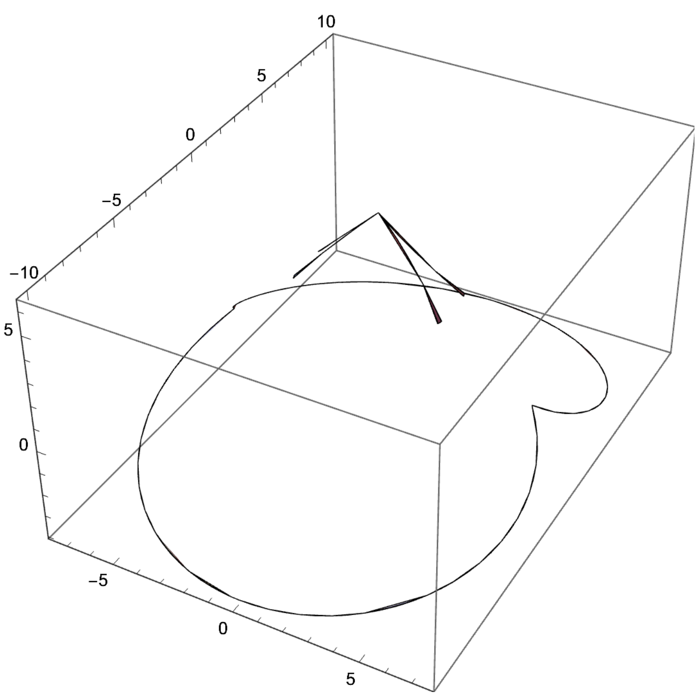


$$\text{RevolutionPlot3D}\left[\left\{-2\sqrt{3\pi^2\,\text{Sin}[\beta]^2-\pi^2\,\text{Sin}[\beta]^4+2\pi^2\,\text{Sin}[\beta]^2\sqrt{1-\text{Sin}[\beta]^2}}\,,\;2\sqrt{3\pi^2\,\text{Sin}[\beta]^2-\pi^2\,\text{Sin}[\beta]^4+2\pi^2\,\text{Sin}[\beta]^2\sqrt{1-\text{Sin}[\beta]^2}}\right\},\{\beta,-\pi,\pi\}\right]$$



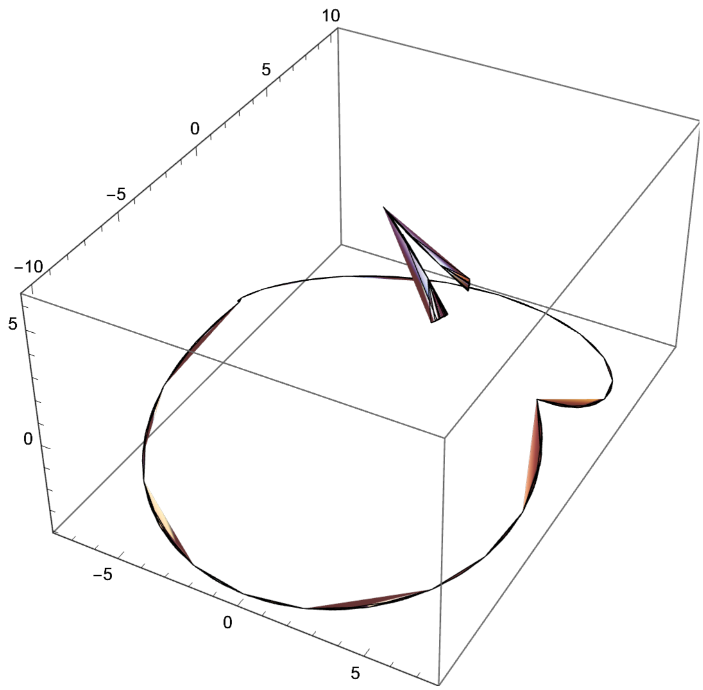
Of course, the above visualizations are all just a single potential scaling of the function. For instance, when we take the function :

$$\text{RevolutionPlot3D}\left[\left\{\frac{\pi\,r-\sqrt{\pi^2\,r^2-4\pi^2\,r\sqrt{r^2\,\text{Sin}[\beta]^2}}}{r},\;\frac{\pi\,r+\sqrt{\pi^2\,r^2-4\pi^2\,r\sqrt{r^2\,\text{Sin}[\beta]^2}}}{r}\right\},\{r,-1,1\},\{\beta,-\pi,\pi\}\right]$$

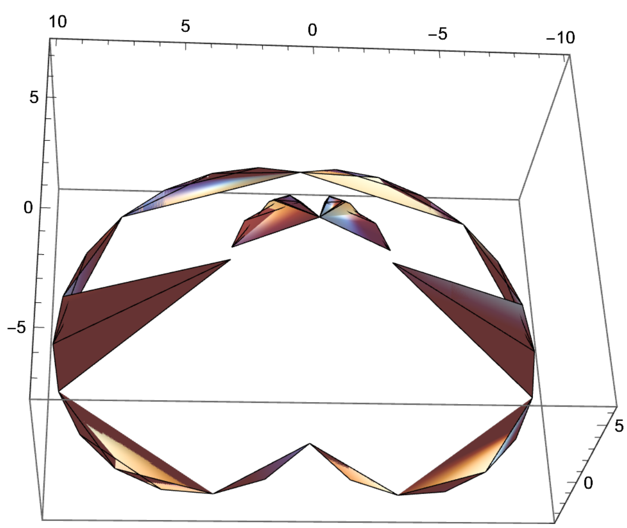


And scale it differently, we see a totally interconnected realm of designs.

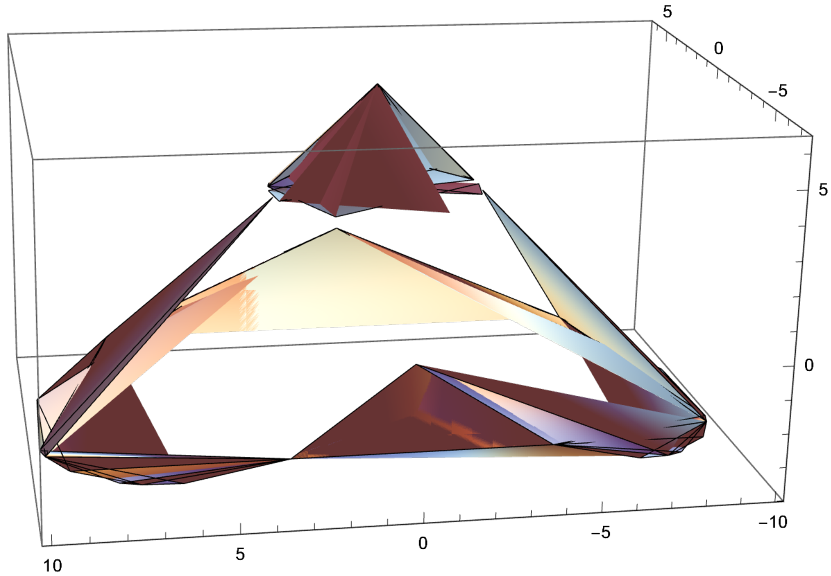
$$\text{RevolutionPlot3D}\left[\left\{\frac{\pi\,r-\sqrt{\pi^2\,r^2-4\,\pi^2\,r\,\sqrt{r^2\,\text{Sin}[\beta]^2}}}{r},\ \frac{\pi\,r+\sqrt{\pi^2\,r^2-4\,\pi^2\,r\,\sqrt{r^2\,\text{Sin}[\beta]^2}}}{r}\right\},\ \{r,-1,1\},\ \{\beta,-2\,\pi,2\,\pi\}\right]$$



$$\text{RevolutionPlot3D}\left[\left\{\frac{\pi\,r-\sqrt{\pi^2\,r^2-4\,\pi^2\,r\,\sqrt{r^2\,\text{Sin}[\beta]^2}}}{r},\ \frac{\pi\,r+\sqrt{\pi^2\,r^2-4\,\pi^2\,r\,\sqrt{r^2\,\text{Sin}[\beta]^2}}}{r}\right\},\ \{r,-1,1\},\ \{\beta,-4\,\pi,4\,\pi\}\right]$$



$$\text{RevolutionPlot3D}\left[\left\{\frac{\pi\, r - \sqrt{\pi^2\, r^2 - 4\, \pi^2\, r\, \sqrt{r^2\, \text{Sin}[\beta]^2}}}{r}, \frac{\pi\, r + \sqrt{\pi^2\, r^2 - 4\, \pi^2\, r\, \sqrt{r^2\, \text{Sin}[\beta]^2}}}{r}\right\}, \{r, -1, 1\}, \{\beta, -8\, \pi, 8\, \pi\}\right]$$



$$\text{RevolutionPlot3D}\left[\left\{\frac{\pi\, r - \sqrt{\pi^2\, r^2 - 4\, \pi^2\, r\, \sqrt{r^2\, \text{Sin}[\beta]^2}}}{r}, \frac{\pi\, r + \sqrt{\pi^2\, r^2 - 4\, \pi^2\, r\, \sqrt{r^2\, \text{Sin}[\beta]^2}}}{r}\right\}, \{r, -1, 1\}, \{\beta, -16\, \pi, 16\, \pi\}\right]$$

When more generally, we can understand that the function for the distance, η, and the function for the distance, r are different spheres. We can then discuss what the change in volume would be between these two spheres.

$$\texttt{Solve}\Big[\theta == \frac{4\,\pi}{3} - \left(-4\,\pi^2 + 12\,\pi^2\, \texttt{Sin}[\beta]^2\right) \Big/ \left(6\left(-\pi^3 + 18\,\pi^3\, \texttt{Sin}[\beta]^2 + 3\,\sqrt{3}\,\sqrt{-\pi^6\, \texttt{Sin}[\beta]^2 + 11\,\pi^6\, \texttt{Sin}[\beta]^4 + \pi^6\, \texttt{Sin}[\beta]^6}\right)^{1/3}\right) + \frac{2}{3}\left(-\pi^3 + 18\,\pi^3\, \texttt{Sin}[\beta]^2 + 3\,\sqrt{3}\,\sqrt{-\pi^6\, \texttt{Sin}[\beta]^2 + 11\,\pi^6\, \texttt{Sin}[\beta]^4 + \pi^6\, \texttt{Sin}[\beta]^6}\right)^{1/3},\ \beta\Big]$$

Solutions for the Speed of Light

The Tearing of Space - Time?

In order to visualize these functions, we must set the internal velocity equal to something more specific.

Earlier, we showed that:

$$\left\{\left\{v \to -\left(1.\ \sqrt{\left(3.54814\times 10^{18} - 1.12941\times 10^{18}\,\theta + 8.98755\times 10^{16}\,\theta^2\right)}\right) \Big/ \left(\sqrt{39.4784 - 12.5664\,\theta + \theta^2}\right)\right\}, \left\{v \to \left(\sqrt{\left(3.54814\times 10^{18} - 1.12941\times 10^{18}\,\theta + 8.98755\times 10^{16}\,\theta^2\right)}\right) \Big/ \left(\sqrt{39.4784 - 12.5664\,\theta + \theta^2}\right)\right\}\right\} \quad (43)$$

when the height of the cone equals the initial radius.

Thus, if we use the positive solutions for velocity, we can visualize these functions for the speed of light.

```
v :=
√ (3.5481432270250993`*^18 - 1.1294090667581471`*^18 θ + 8.987551787368176`*^16 θ^2) /
 ( √39.47841760435743` - 12.566370614359172` θ + θ^2 )
```

Numbers have specific meanings based on their discrete sets of solutions relating to the structure of light through time. For instance, the reduced time traveled by a single wavelength of light has 22 solutions in terms of the mass of that light.

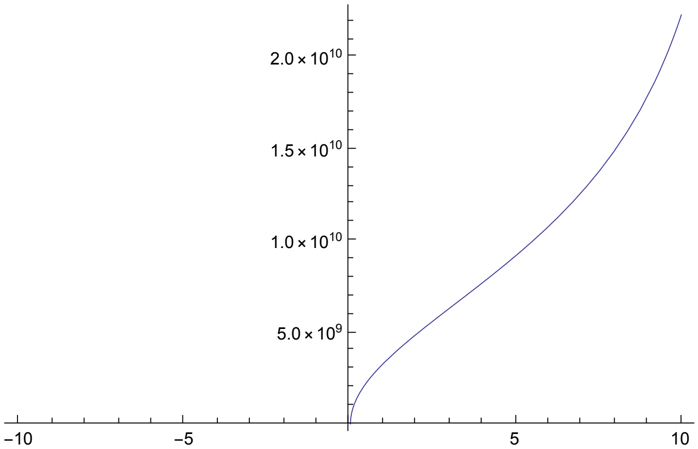
Previously, it was shown that the radius of our initial circle can be expressed in terms of the height of a cone and a given angle through which the initial circle is folded, pulling a cone into the third dimension.

$$\left\{r \to \frac{2\,h\,\pi}{\sqrt{4\,\pi\,\theta - \theta^2}}\right\} \tag{51}$$

$$h = c * 6 * \theta;\ \text{where } c \simeq (3.0 * 10^{\wedge}8) \tag{52}$$

In our space-time model, the cone extends through its height at the speed of light. Although, for every distance r traveled by the light, through a certain amount of time, into the dimension represented by the distance h, the circumference of the initial circle declines at a rate such that the distance that theta covers in arc lengths relating to the circumference of the base of the cone and the radial distance covered, does not exceed r. For, if it did exceed r, light would have a specific geometric element that goes faster than light, which is a paradox of the highest order.

$$\text{Plot}\left[\frac{2\,(3.0*10\text{^}8)\,(6)\,(\theta)\,\pi}{\sqrt{4\,\pi\,\theta-\theta^2}}, \{\theta, -10, 10\}\right]$$



$$r = \frac{2\,(3.0*10\text{^}8)\,(6)\,(\Theta)\,\pi}{\sqrt{4\,\pi\,\Theta-\Theta^2}}$$

$$\frac{4\,\pi^2\,h^2}{4\,\pi\,\Theta-\Theta^2} = r^2$$

We are now going to redefine the variable h to distinguish it from Planck' s constant.

From this point forth, what was previously known as the variable h, height, will now be termed y, and it is the height of the cone.

$$\frac{4\,\pi^2\,y^2}{4\,\pi\,\Theta-\Theta^2} = r^2$$

h is Planck' s Constant and is expressible by :

h = 6.62606896*10^–34

6.62607×10^{-34}

E = h ν, where E is energy, h is Planck ' s Constant, and ν is frequency. (53)

E = ℏ ω, where E is energy, h – bar is h / 2 π, and omega is angular frequency. (54)

v = λ ν, where v is velocity, λ is wavelength, and f is frequency. (55)

E = m c ^ 2, where E is energy, m is mass, and c is the speed of light. (56)

We will now say that the wavelength, λ, has the quality of the geometric system that takes a circle and folds it into a cone. That wavelength can be described by the function of height and angle, and reduced to being purely in terms of theta.

$$r = \frac{2\,(3.0*10\text{^}8)\,(6)\,(\theta)\,\pi}{\sqrt{4\,\pi\,\theta-\theta^2}} = \lambda$$

We know that only radiant energy is available to the eye for stimuli. I will now show that this radiant energy can be expressed in terms of the parameters of the cone. The wavelength of light is the height of the cone, and the velocity of the light is equal to the speed of light in a vaccuum. Therefore, we can place the energy of the light in terms of the speed of light, the initial radius of the circle, and the velocity of light. We can then show that information available in this energy comes in the idea of illusory contour. This mean that everything we see is an illusion.

$$\text{velocity} = \lambda\nu = \eta\nu = \frac{\sqrt{4\pi r^2\theta - r^2\theta^2}}{2\pi}\nu = \frac{\sqrt{4\pi r^2\theta - r^2\theta^2}}{2\pi}\left(\frac{1}{\left(\frac{\theta}{k}\right)}\right) = c$$

This piece is made entirely of lines,
as are all the pieces of this section. We experience both actual and virtual contour in this diagram.This comes from the meshing of individual lines and the foreshortening of their contextual meaning to the space through being placed at different depths and different angles. Because of the individual foreshortening of each line,
we are capable of detecting the non - rigid gradient when the object rotates,
or when we rotate with regard to the object. The object of perception in this situation is a graphing of a single wavelngth of external stimulus energy (radiant energy, i.e. light). The idea of compression allows us to understand the meaning of the perceived creases created from darker,
denser areas of the gradient. The relationship between the external stimulus energy and the perceived non - rigid motion through visualizing this stimulus energy existing objectively in space through the angular transition of β and θ elucidates how actual contour is perceived through the combination of individual stimuli on the retina.In relation to the more straightforward example of perceiving rigid motion,
Gibson has said that, "In general, the greater the slant of a physical surface the steeper will be all of these retinal gradients, and the steeper they are, we may postulate, the greater will be the impression of slant" (The Visual World, 174). It could also be noted that gradients of shading yield the illusion of depth on two dimensional depictions. We can also tell that there is three dimensional information of depth within a single external stimuli (wavelength of light). With actual three dimensional visualizations of radiant energy,
we find that the idea of illusory contour is extremely important,
and that the idea of a projective plane can be defined by the inherent structure of light stimulus. That in essence, the absence of line is the positive presence of depth perception. Gibson has also noted that,
"The illumination of a given surface, then, is a function of the orientation of the surface toward or away from the source of light" (The Visual World, 94). This suggests that an object has a real contour,
but if all the information received by the visual system alone is delivered through virtual contour,
we cannot say that anything but virtual contour is actually perceived.

"Conic" Relativity: Expositions of Relativity through Difference in Circumferences of Two Circles

In this paper,
I will perform a "limited" exposition of the general principle, $\theta\, r =$

$$2\,\pi\,r\ -2\,\pi\,x\ =\ 2\,\pi\,r\ -2\,\pi\,r'\ =\ 2\,\pi\,r\ -2\,\pi\,r\,\sqrt{1 - \frac{(v)^2}{c^2}}\ == 2\,\pi\,r\ -2\,\pi\,\sqrt{r^2 - \eta^2},$$

from the algebraicized geometry of a cone combined with the

relativistic length contraction first suggested by Einstein' s application of the Lorentz transformation in his theory of relativity. The exposition is limited. I will only solve equations for expressions of velocity and expressions of angle measure. I will not make substitutions. The system is multi – variant in the sense that there are so many different possible combinations of algebraic forms that one would have to take a very long extended exposition in order to visualize all of them.

"The language of matter expresses the same quality of motion as the meaning of the creative thought/idea field. In order to perceive motion, one must set aside certain quantifiable characteristics of the existence of transformation. This leads to insight into a relationship and mutual interpenetration of mathematics and ethics." - Emmerson

For more information about how Einstein applied the Lorentz transformation to describe length contraction, see :

Einstein, Albert.Relativity : The Special and the General Theory (Classic Reprint). Forgotten Books, 2010. Print.

This is an original interpretation of the notion of a length contraction as it would relate to the difference in circumferences of two circles.

Table of Contents :

Height of the cone equals the length contracted initial radius :

$$\eta = r' = \frac{\sqrt{4\pi r^2 \theta - r^2 \theta^2}}{2\pi} = r\sqrt{1 - \frac{(v)^2}{c^2}} =$$

$$\frac{2\pi\eta}{\sqrt{4\pi\theta - \theta^2}}\sqrt{1 - \frac{(v)^2}{c^2}} = \frac{2\pi\sqrt{(4\pi - \theta)\,\theta}}{(4\pi - \theta)\,\theta}\sqrt{1 - \frac{(v)^2}{c^2}}$$

$2\pi\eta - 2\pi r' = \phi\,\eta$, where ϕ is an angle of a similar dimensional kind to theta, but different.

$2\pi\eta - 2\pi r' = \theta\,\eta$

$2\pi r' - 2\pi\eta = \phi\,\eta$, where ϕ is an angle of a similar dimensional kind to theta, but

different. - This section is not visualized in this paper, but implied.

$2\pi r - 2\pi\eta = \theta\eta$ - This section will not be visualized in this paper, but is implied.

Changed radius equals the
length contracted initial radius :

$$x = r' = \frac{2\pi r - r\theta}{2\pi} = r\sqrt{1 - \frac{(v)^2}{c^2}} =$$

$$\frac{2\pi\eta}{\sqrt{4\pi\theta - \theta^2}}\sqrt{1 - \frac{(v)^2}{c^2}} = \frac{2\pi\sqrt{(4\pi - \theta)\,\theta}}{(4\pi - \theta)\,\theta}\sqrt{1 - \frac{(v)^2}{c^2}}$$

$2\pi x - 2\pi r' = \vartheta\eta$, where ϑ is an angle of a similar dimensional kind to theta, but different.

$2\pi x - 2\pi r' = \theta\eta$

$2\pi r' - 2\pi x = \vartheta\eta$, where ϑ is an angle of a similar dimensional kind to theta, but different is implied but not visualized in this paper.

$2\pi r' - 2\pi x = \vartheta\eta$ is implied but not visualized in this paper.

Height of the cone equals the
length contracted "changed radius" : $\eta =$

$$x' = \frac{\sqrt{4\pi r^2\theta - r^2\theta^2}}{2\pi} == \frac{2\pi r - r\theta}{2\pi}\sqrt{1 - \frac{(v)^2}{c^2}}$$

$2\pi\eta - 2\pi x' = \omega\eta$, where ω is an angle of a similar dimensional kind to theta, but different.

Synchronized angles: $2\pi\eta - 2\pi x' = \theta\eta$

Changed radius equals the
length contracted height of the cone :

$$x = \eta' = \frac{2\pi r - r\theta}{2\pi} = \frac{\sqrt{4\pi r^2\theta - r^2\theta^2}}{2\pi}\sqrt{1 - \frac{(v)^2}{c^2}}$$

$2\pi x - 2\pi\eta' = \rho\,\eta$, where ρ is an angle of a similar dimensional kind to theta, but different.

$2\pi x - 2\pi\eta' = \theta\,\eta$

There are also the implied forms : $\eta' = r$ and $x' = r$ with their respective

Commentary on the Forms

One commentary on the forms is their semblance to the position at which the instantaneous rate of change of the height of the cone equals the average rate of change of the height of the cone with respect to theta. Please see A Geometric Pattern of Perception (Emmerson, 2009), for more background information regarding the system of the univocal cone transformation. The six potential equalities of the system wind up miming the 30 - 60 - 90 position at which the instantaneous velocity of the height of the cone equals the average velocity of the height of the cone. When plotted, the 45 - 45 - 90 cone is evident within process of solving for this position.

"Conic" Relativity: Expositions of Relativity through Difference in Circumferences of Two Circles

In this paper,
I will perform a "limited" exposition of the general principle, θ r =

$$2\pi r - 2\pi x = 2\pi r - 2\pi r' = 2\pi r - 2\pi r\sqrt{1 - \frac{(v)^2}{c^2}} == 2\pi r - 2\pi\sqrt{r^2 - \eta^2},$$

from the algebraicized geometry of a cone combined with the relativistic length contraction first suggested by Einstein' s application of the Lorentz transformation in his theory of relativity. The exposition is limited. I will only solve equations for expressions of velocity and expressions of angle measure. I will not make substitutions. The system is multi - variant in the sense that there are so many different possible combinations of algebraic forms that one would have to take a very long extended exposition in order to visualize all of them.

"The language of matter expresses the same quality of motion as the meaning of the creative thought/idea field. In order to perceive motion, one must set aside certain quantifiable characteristics of the existence of transformation. This leads to insight into a relationship and mutual interpenetration of mathematics and ethics." - Emmerson

For more information about how Einstein applied the Lorentz transformation to describe length contraction, see :

Einstein, Albert.Relativity : The Special and the General Theory (Classic Reprint). Forgotten Books, 2010. Print.

This is an original interpretation of the notion of a length contraction as it would relate to the difference in circumferences of two circles.

Table of Contents :

Height of the cone equals the length contracted initial radius :

$$\eta = r' = \frac{\sqrt{4\pi r^2\theta - r^2\theta^2}}{2\pi} =$$

$$r\sqrt{1 - \frac{(v)^2}{c^2}} = \frac{2\pi\eta}{\sqrt{4\pi\theta - \theta^2}}\sqrt{1 - \frac{(v)^2}{c^2}} =$$

$$\Bigg(\Bigg(-4\pi\theta + \theta^2 + 2\pi\sqrt{(4\pi - \theta)\,\theta}\,\text{Sin}[\beta] +$$

$$4\,\pi^2\,\mathrm{Sin}[\beta]^2-\frac{2\,\pi^2\,\sqrt{(4\,\pi-\theta)\,\theta}\,\mathrm{Sin}[\beta]^3}{4\,\pi-\theta}-\frac{2\,\pi^2\,\sqrt{(4\,\pi-\theta)\,\theta}\,\mathrm{Sin}[\beta]^3}{\theta}\Bigg)\Bigg/\left(16\,\pi^2\,\theta-12\,\pi\,\theta^2+2\,\theta^3-16\,\pi^3\,\mathrm{Sin}[\beta]^2+8\,\pi^2\,\theta\,\mathrm{Sin}[\beta]^2\right)\Bigg)\sqrt{1-\frac{(\mathrm{v})^2}{\mathrm{c}^2}}=$$

$$\Bigg(\Big(-8\,\pi^3+4\,\pi^2\,\sqrt{(4\,\pi-\theta)\,\theta}\,\mathrm{Csc}[\beta]+8\,\pi^2\,\theta\,\mathrm{Csc}[\beta]^2-2\,\pi\,\theta^2\,\mathrm{Csc}[\beta]^2-4\,\pi\,\theta\,\sqrt{(4\,\pi-\theta)\,\theta}\,\mathrm{Csc}[\beta]^3+\theta^2\,\sqrt{(4\,\pi-\theta)\,\theta}\,\mathrm{Csc}[\beta]^3\Big)\Big/\Big(4\,\big(8\,\pi^4-4\,\pi^3\,\theta-8\,\pi^3\,\theta\,\mathrm{Csc}[\beta]^2+6\,\pi^2\,\theta^2\,\mathrm{Csc}[\beta]^2-\pi\,\theta^3\,\mathrm{Csc}[\beta]^2\big)\Big)\Bigg)\sqrt{1-\frac{(\mathrm{v})^2}{\mathrm{c}^2}}=$$

$$\Bigg(\Bigg(-4\,\pi^2-4\,\pi\,\gamma-\gamma^2+\sqrt{\gamma}\,\sqrt{(2\,\pi+\gamma)^2}\,\sqrt{4\,\pi+\gamma}\,\mathrm{Csc}[\beta]+4\,\pi\,\gamma\,\mathrm{Csc}[\beta]^2+\gamma^2\,\mathrm{Csc}[\beta]^2-\sqrt{\gamma}\,\sqrt{(2\,\pi+\gamma)^2}\,\sqrt{4\,\pi+\gamma}\,\mathrm{Csc}[\beta]^3+\frac{4\,\pi^2\,\sqrt{\gamma}\,\sqrt{(2\,\pi+\gamma)^2}\,\sqrt{4\,\pi+\gamma}\,\mathrm{Csc}[\beta]^3}{(2\,\pi+\gamma)^2}\Bigg)\Bigg/\Big(\pi\,\big(-16\,\pi^2-16\,\pi\,\gamma-4\,\gamma^2+16\,\pi\,\gamma\,\mathrm{Csc}[\beta]^2+4\,\gamma^2\,\mathrm{Csc}[\beta]^2\big)\Big)\Bigg)\sqrt{1-\frac{(\mathrm{v})^2}{\mathrm{c}^2}}=$$

$$\Bigg(\Bigg(4\,\pi\,\gamma+\gamma^2-\sqrt{\gamma}\,\sqrt{(2\,\pi+\gamma)^2}\,\sqrt{4\,\pi+\gamma}\,\mathrm{Sin}[\beta]-4\,\pi^2\,\mathrm{Sin}[\beta]^2-4\,\pi\,\gamma\,\mathrm{Sin}[\beta]^2-$$

$$\gamma^2 \text{Sin}[\beta]^2 - \frac{\pi \sqrt{\gamma} \sqrt{(2\pi+\gamma)^2} \text{Sin}[\beta]^3}{\sqrt{4\pi+\gamma}} +$$

$$\frac{\pi \sqrt{(2\pi+\gamma)^2} \sqrt{4\pi+\gamma} \text{Sin}[\beta]^3}{\sqrt{\gamma}} +$$

$$\left.\sqrt{\gamma} \sqrt{(2\pi+\gamma)^2} \sqrt{4\pi+\gamma} \text{Sin}[\beta]^3\right) \Big/$$

$$\left(\pi \left(-16\pi\gamma - 4\gamma^2 + 16\pi^2 \text{Sin}[\beta]^2 + 16\pi\gamma\right.\right.$$

$$\left.\left.\text{Sin}[\beta]^2 + 4\gamma^2 \text{Sin}[\beta]^2\right)\right) \sqrt{1 - \frac{(v)^2}{c^2}}$$

$2\pi\eta - 2\pi r' = \phi\eta$, where ϕ is an angle of a similar dimensional kind to theta, but different.

$2\pi\eta - 2\pi r' = \theta\eta$

$2\pi r' - 2\pi\eta = \phi\eta$, where ϕ is an angle of a similar dimensional kind to theta, but different. - This section is not visualized in this paper, but implied.

$2\pi r - 2\pi\eta = \theta\eta$ - This section will not be visualized in this paper, but is implied.

Changed radius equals the length contracted initial radius :

$$x = r' = \frac{2\pi r - r\theta}{2\pi} = r\sqrt{1 - \frac{(v)^2}{c^2}} = \frac{2\pi\eta}{\sqrt{4\pi\theta - \theta^2}} \sqrt{1 - \frac{(v)^2}{c^2}} =$$

$$\left(\left(-4\pi\theta + \theta^2 + 2\pi\sqrt{(4\pi-\theta)\theta} \text{Sin}[\beta] +\right.\right.$$

$$4\pi^2 \text{Sin}[\beta]^2 - \frac{2\pi^2 \sqrt{(4\pi-\theta)\theta} \text{Sin}[\beta]^3}{4\pi-\theta} -$$

$$\left.\frac{2\pi^2 \sqrt{(4\pi-\theta)\theta} \text{Sin}[\beta]^3}{\theta}\right) \Big/ \left(16\pi^2\theta - 12\pi\theta^2 +\right.$$

$$2\,\theta^3 - 16\,\pi^3\,\mathrm{Sin}[\beta]^2 + 8\,\pi^2\,\theta\,\mathrm{Sin}[\beta]^2\Big)\Bigg)\,\sqrt{1-\frac{(v)^2}{c^2}} =$$

$$\Bigg(\Big(-8\,\pi^3 + 4\,\pi^2\,\sqrt{(4\,\pi-\theta)\,\theta}\,\mathrm{Csc}[\beta] + 8\,\pi^2\,\theta\,\mathrm{Csc}[\beta]^2 - 2\,\pi\,\theta^2\,\mathrm{Csc}[\beta]^2 - 4\,\pi\,\theta\,\sqrt{(4\,\pi-\theta)\,\theta}\,\mathrm{Csc}[\beta]^3 + \theta^2\,\sqrt{(4\,\pi-\theta)\,\theta}\,\mathrm{Csc}[\beta]^3\Big)\Big/$$

$$\Big(4\,\Big(8\,\pi^4 - 4\,\pi^3\,\theta - 8\,\pi^3\,\theta\,\mathrm{Csc}[\beta]^2 + 6\,\pi^2\,\theta^2\,\mathrm{Csc}[\beta]^2 - \pi\,\theta^3\,\mathrm{Csc}[\beta]^2\Big)\Big)\Bigg)\,\sqrt{1-\frac{(v)^2}{c^2}} =$$

$$\Bigg(\Bigg(-4\,\pi^2 - 4\,\pi\,\gamma - \gamma^2 + \sqrt{\gamma}\,\sqrt{(2\,\pi+\gamma)^2}\,\sqrt{4\,\pi+\gamma}\,\mathrm{Csc}[\beta] + 4\,\pi\,\gamma\,\mathrm{Csc}[\beta]^2 + \gamma^2\,\mathrm{Csc}[\beta]^2 - \sqrt{\gamma}\,\sqrt{(2\,\pi+\gamma)^2}\,\sqrt{4\,\pi+\gamma}\,\mathrm{Csc}[\beta]^3 + \frac{4\,\pi^2\,\sqrt{\gamma}\,\sqrt{(2\,\pi+\gamma)^2}\,\sqrt{4\,\pi+\gamma}\,\mathrm{Csc}[\beta]^3}{(2\,\pi+\gamma)^2}\Bigg)\Bigg/$$

$$\Big(\pi\,\Big(-16\,\pi^2 - 16\,\pi\,\gamma - 4\,\gamma^2 + 16\,\pi\,\gamma\,\mathrm{Csc}[\beta]^2 + 4\,\gamma^2\,\mathrm{Csc}[\beta]^2\Big)\Big)\Bigg)\,\sqrt{1-\frac{(v)^2}{c^2}} =$$

$$\Bigg(\Bigg(4\,\pi\,\gamma + \gamma^2 - \sqrt{\gamma}\,\sqrt{(2\,\pi+\gamma)^2}\,\sqrt{4\,\pi+\gamma}\,\mathrm{Sin}[\beta] - 4\,\pi^2\,\mathrm{Sin}[\beta]^2 - 4\,\pi\,\gamma\,\mathrm{Sin}[\beta]^2 - \gamma^2\,\mathrm{Sin}[\beta]^2 - \frac{\pi\,\sqrt{\gamma}\,\sqrt{(2\,\pi+\gamma)^2}\,\mathrm{Sin}[\beta]^3}{\sqrt{4\,\pi+\gamma}} + \frac{\pi\,\sqrt{(2\,\pi+\gamma)^2}\,\sqrt{4\,\pi+\gamma}\,\mathrm{Sin}[\beta]^3}{\sqrt{\gamma}} +$$

$$\left.\sqrt{\gamma}\ \sqrt{(2\pi+\gamma)^2}\ \sqrt{4\pi+\gamma}\ \mathrm{Sin}[\beta]^3\right)\Big/ \left(\pi\left(-16\pi\gamma-4\gamma^2+16\pi^2\,\mathrm{Sin}[\beta]^2+16\pi\gamma\,\mathrm{Sin}[\beta]^2+4\gamma^2\,\mathrm{Sin}[\beta^2]\right)\right)\sqrt{1-\frac{(v)^2}{c^2}}$$

$2\pi x - 2\pi r' = \vartheta\,\eta$, where ϑ is an angle of a similar dimensional kind to theta, but different.

$2\pi x - 2\pi r' = \theta\,\eta$

$2\pi r' - 2\pi x = \vartheta\,\eta$, where ϑ is an angle of a similar dimensional kind to theta, but different is implied but not visualized in this paper.

$2\pi r' - 2\pi x = \vartheta\,\eta$ is implied but not visualized in this paper.

Height of the cone equals the length contracted "changed radius" : $\eta = x' =$

$$\frac{\sqrt{4\pi r^2\theta - r^2\theta^2}}{2\pi} == \frac{2\pi r - r\theta}{2\pi}\sqrt{1-\frac{(v)^2}{c^2}} = \frac{2\pi r}{2\pi+\gamma}\sqrt{1-\frac{(v)^2}{c^2}}$$

$2\pi\eta - 2\pi x' = \omega\,\eta$, where ω is an angle of a similar dimensional kind to theta, but different.

Synchronized angles: $2\pi\eta - 2\pi x' = \theta\,\eta$

Changed radius equals the length contracted height of the cone :

$$x = \eta' = \frac{2\pi r - r\theta}{2\pi} = \frac{\sqrt{4\pi r^2\theta - r^2\theta^2}}{2\pi}\sqrt{1-\frac{(v)^2}{c^2}} =$$

$$\frac{x\sqrt{\gamma}\ \sqrt{4\pi+\gamma}}{2\pi}\sqrt{1-\frac{(v)^2}{c^2}} = \frac{r\sqrt{\gamma}\ \sqrt{4\pi+\gamma}}{\sqrt{4\pi^2+4\pi\gamma+\gamma^2}}\sqrt{1-\frac{(v)^2}{c^2}}$$

$2\pi x - 2\pi\eta' = \rho\,\eta$, where ρ is an angle of a similar dimensional kind to theta, but different.

$2\pi x - 2\pi\eta' = \theta\,\eta$

There are also the implied forms : $\eta' = r$ and $x' = r$ with their respective

Commentary on the Forms

One commentary on the forms is their semblance to the position at which the instantaneous rate of change of the height of the cone equals the average rate of change of the height of the cone with respect to theta. Please see A Geometric Pattern of Perception (Emmerson, 2009), for more background information regarding the system of the univocal cone transformation. The six potential equalities of the system wind up miming the 30 - 60 - 90 position at which the instantaneous velocity of the height of the cone equals the average velocity of the height of the cone. When plotted, the 45 - 45 - 90 cone is evident within process of solving for this position.

Perceptual Space Applied to the Uncertainty Model of Physics

by Parker Emmerson with assistance from Andrew Berisha

A bit of Philosophy of Perception. Also, see the Geometric Pattern of Perception of the Moon from beneath the Legs by Parker Emmerson.

$c = 3.0 * 10^8 m / s$

$C = 2 \pi r$

This is the circumference of our initial circle of radius r

$C_2 = 2 \pi r_1$

This is the circumference of our second circle,
the base of the cone, of radius r_1

$r^2 = r_1^2 + \eta^2$

This is the initial radius squared expressed as the slant of
the cone in terms of the height of the cone, η, and the radius
of the base of the cone, r_1

$$r = \sqrt{(r_1^2 + \eta^2)} \tag{59}$$

$t = \theta r$

$t / \theta = r$

The arc length taken out of a circle at a given time is =
$t = C - C_2 = 2 \pi r - 2 \pi r_1 = \theta r$ → Equation 7

$r_1^2 == r^2 - \eta^2$

$r_1 = \sqrt{(r^2 - \eta^2)}$

$h \leq r$

τ = time

1 second = 6 degrees

πr_1^2 = Area = $n \eta^2$

To construct a square of the same area as a given circle, we will begin with the postulates above regarding the geometry of a cone.

When, "relationship is added to non relational stimuli" (Perception, MacLeod and Pick for Gibson, 24), illusion is able to be understood through phenomenology. We can use mathematics like a language for disussing its structural elements.

The derivative of zero is equal to the derivative of an equation that is equal to 0.

```
Solve[r1^2 + η^2 == r^2, η]
```

$\left\{\left\{\eta \to -\sqrt{r^2 - r_1^2}\right\}, \left\{\eta \to \sqrt{r^2 - r_1^2}\right\}\right\}$

$$\left\{\left\{\eta \to -\sqrt{r^2 - r_1^2}\right\}, \left\{\eta \to \sqrt{r^2 - r_1^2}\right\}\right\} \tag{60}$$

$(t / \theta) = r$

$t = C - C_2 = 2 \pi r - 2 \pi r_1 = 2 \pi (t / \theta) - 2 \pi \sqrt{((t / \theta)^2 - \eta^2)}$

$t == 2 \pi (t / \theta) - 2 \pi \sqrt{((t / \theta)^2 - \eta^2)}$

Add $2\pi\sqrt{((r)^2-\eta^2)}$ to both sides

$t+2\pi\sqrt{((t/\theta)^2-\eta^2)} = 2\pi(t/\theta)$

Subtract t from both sides and remember that $(t/\theta) = r$

$2\pi\sqrt{((t/\theta)^2-(\eta^2))} = 2\pi(t/\theta) - t = 2\pi r - t$

Divide by 2π on both sides.

$(t/\theta) - t/(2\pi) = (r) - t/(2\pi) = \sqrt{((t/\theta)^2-(\eta^2))} = \sqrt{((r)^2-(\eta^2))} = r_1$

Square both sides. Substitute : $(t/\theta) = r$

$((t/\theta)-(t/(2\pi)))^2 = ((r)-(t/(2\pi)))^2 = ((t/\theta)^2-(\eta^2)) = (r_1^2)$

$((r)-(t/(2\pi)))^2 = ((r)^2-(\eta^2))$

Add η^2 to both sides.

$((r) - (t/(2\pi)))^2 + (\eta^2) = (r)^2$

Substitute : $\theta r=t$

$((t/\theta) - (t/(2\pi)))^2 = ((r) - (\theta*r/(2\pi)))^2$

$((r)-(\theta*r/(2\pi)))^2$

$$\left(r-\frac{r\,\theta}{2\pi}\right)^2$$

$$\text{Expand}\left[\left(r-\frac{r\,\theta}{2\pi}\right)^2\right]$$

$$r^2-\frac{r^2\,\theta}{\pi}+\frac{r^2\,\theta^2}{4\pi^2}$$

$$r^2-\frac{r^2\,\theta}{\pi}+\frac{r^2\,\theta^2}{4\pi^2}+\eta^2 = ((r)-(t/2\pi))^2+(\eta^2) = r^2$$

$$(r^2)-\left(r^2-\frac{r^2\,\theta}{\pi}+\frac{r^2\,\theta^2}{4\pi^2}\right)=\eta^2$$

$$\text{Simplify}\left[(r^2)-\left(r^2-\frac{r^2\,\theta}{\pi}+\frac{r^2\,\theta^2}{4\pi^2}\right)\right]$$

$$\frac{r^2\,(4\pi-\theta)\,\theta}{4\pi^2}=\eta^2 \tag{61}$$

$$\text{Solve}\left[\frac{r^2\,(4\pi-\theta)\,\theta}{4\pi^2}==\eta^2,\eta\right]$$

$$\left\{\left\{\eta\to-\frac{\sqrt{4\pi\,r^2\,\theta-r^2\,\theta^2}}{2\pi}\right\},\left\{\eta\to\frac{\sqrt{4\pi\,r^2\,\theta-r^2\,\theta^2}}{2\pi}\right\}\right\}$$

$$\frac{2\,\eta\,\pi}{\sqrt{4\pi\,\theta-\theta^2}}=r \tag{62}$$

$$\frac{2\ (r\ /\ 6\ \theta)\ (6\ \theta))\ \pi}{\sqrt{4\ \pi\ \theta - \theta^2}} = r = \frac{2\ r\pi}{\sqrt{4\ \pi\ \theta - \theta^2}} \tag{63}$$

$$\textbf{Solve}\left[1 == \frac{2\ \pi}{\sqrt{4\ \pi\ \theta - \theta^2}},\ \theta\right]$$

$\{\{\theta \to 2\ \pi\}\}$

This is the equation for r_1 in terms of the geometric parameters of the cone described above.

$\pi\ (r\hat{}2 - \eta\hat{}2) == \pi\ r_1\hat{}2$

Then, we substitute for the solved height in terms of purely theta and radius.

$$\textbf{Solve}\left[\pi\left(r\hat{}2 - \left(\frac{r^2\ (4\ \pi - \theta)\ \theta}{4\ \pi^2}\right)\right) == \pi\left(r\hat{}2 - \left(\frac{r^2\ (4\ \pi - \theta)\ \theta}{4\ \pi^2}\right)\right)\hat{}2,\ r\right]$$

$$\left\{\{r \to 0\},\ \{r \to 0\},\ \left\{r \to -\frac{2\ \pi\ \sqrt{4\ \pi^2 - 4\ \pi\ \theta + \theta^2}}{\sqrt{16\ \pi^4 - 32\ \pi^3\ \theta + 24\ \pi^2\ \theta^2 - 8\ \pi\ \theta^3 + \theta^4}}\right\},\ \left\{r \to \frac{2\ \pi\ \sqrt{4\ \pi^2 - 4\ \pi\ \theta + \theta^2}}{\sqrt{16\ \pi^4 - 32\ \pi^3\ \theta + 24\ \pi^2\ \theta^2 - 8\ \pi\ \theta^3 + \theta^4}}\right\}\right\} \tag{64}$$

Remember when we said that $\pi\ (r\hat{}2 - \eta\hat{}2) == \pi\ r_1\hat{}2$.

When is the area of h^2 equal to the area of the circle of r_1?

Well, what if $n * \eta\hat{}2 = \pi\ r_1\hat{}2 = \pi\left(r\hat{}2 - \left(\frac{r^2\ (4\ \pi - \theta)\ \theta}{4\ \pi^2}\right)\right)$

If $r_1 = \eta$, then $n = \pi$

Where n is just a given number of h^2 that is related to E = hnf, where n is the number of frequencies, f is the frequency, and h is Planck's constant.

$$E\ =\ hnf = h\nu = mc\hat{}2 \tag{65}$$

$$r\ /\ t = r\ /\ (6\ \theta) = c = \lambda f = r\ (1\ /\ 6\ \theta) \tag{66}$$

v = velocity = $\lambda\nu$, where $\lambda = r$ and is the wavelength, and ν is the frequency. (67)

η **= v * time = (r / t) 6 (**θ**) = (r / (6** θ**)) 6 (**θ**)**

$$\frac{2\ \eta\ \pi}{\sqrt{4\ \pi\ \theta - \theta^2}} = r = \frac{(r\ /\ t)\ 6\ (\theta)\ \pi}{\sqrt{4\ \pi\ \theta - \theta^2}} = \frac{(r\ /\ (6\ \theta))\ 6\ (\theta)\ \pi}{\sqrt{4\ \pi\ \theta - \theta^2}}$$

$$\textbf{Solve}\left[(r\ /\ t) == \frac{(r\ /\ t)\ 6\ (\theta)\ \pi}{\sqrt{4\ \pi\ \theta - \theta^2}} * \nu,\ \nu\right]$$

$$\left\{\left\{\nu \to \frac{\sqrt{(4\ \pi - \theta)\ \theta}}{6\ \pi\ \theta}\right\}\right\} \tag{68}$$

$$\nu := \frac{\sqrt{(4\pi - \theta)\,\theta}}{6\,\pi\,\theta}$$

nf = ν

$$\text{Solve}\left[n\,(1/6\,\theta) == \frac{\sqrt{(4\pi - \theta)\,\theta}}{6\,\pi\,\theta},\, n\right]$$

$$\left\{\left\{n \to \frac{\sqrt{(4\pi - \theta)\,\theta}}{\pi\,\theta^2}\right\}\right\} \tag{69}$$

$$n := \frac{\sqrt{(4\pi - \theta)\,\theta}}{\pi\,\theta^2}$$

Where h is Planck ' s Constant, n the number of moles,
and f the frequency, we may say that the force of dark matter (F_{dm})
is capable of being solved for in terms of time or purely space.

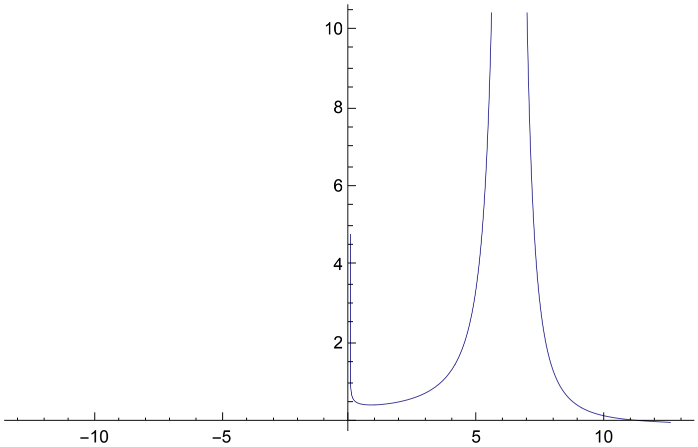
$$\pi\, r_1\text{^}2 = (r\text{^}2 - \eta\text{^}2)\text{^}2 = \pi\left(r\text{^}2 - \left(\frac{r^2\,(4\pi - \theta)\,\theta}{4\,\pi^2}\right)\right)\text{^}2 = n\left(\frac{r^2\,(4\pi - \theta)\,\theta}{4\,\pi^2}\right)$$

The amount n (η^2) is correlated to the area of r_1,
because n is in terms of theta.

$$\text{Solve}\left[\pi\left(r\text{^}2 - \left(\frac{r^2\,(4\pi - \theta)\,\theta}{4\,\pi^2}\right)\right)\text{^}2 == \frac{\sqrt{(4\pi - \theta)\,\theta}}{\pi\,\theta^2}\left(\frac{r^2\,(4\pi - \theta)\,\theta}{4\,\pi^2}\right),\, r\right]$$

$$\left\{\{r \to 0\},\ \{r \to 0\},\ \left\{r \to -\frac{2\,\pi^{3/2}\sqrt{-\frac{\sqrt{(4\pi-\theta)\,\theta}}{\pi^3} + \frac{4\sqrt{(4\pi-\theta)\,\theta}}{\pi^2\,\theta}}}{\sqrt{16\,\pi^4 - 32\,\pi^3\,\theta + 24\,\pi^2\,\theta^2 - 8\,\pi\,\theta^3 + \theta^4}}\right\},\right.$$
$$\left.\left\{r \to \frac{2\,\pi^{3/2}\sqrt{-\frac{\sqrt{(4\pi-\theta)\,\theta}}{\pi^3} + \frac{4\sqrt{(4\pi-\theta)\,\theta}}{\pi^2\,\theta}}}{\sqrt{16\,\pi^4 - 32\,\pi^3\,\theta + 24\,\pi^2\,\theta^2 - 8\,\pi\,\theta^3 + \theta^4}}\right\}\right\} \tag{70}$$

$$\text{Plot}\left[\frac{2\,\pi^{3/2}\,\sqrt{-\frac{\sqrt{(4\,\pi-\theta)\,\theta}}{\pi^3}+\frac{4\,\sqrt{(4\,\pi-\theta)\,\theta}}{\pi^2\,\theta}}}{\sqrt{16\,\pi^4-32\,\pi^3\,\theta+24\,\pi^2\,\theta^2-8\,\pi\,\theta^3+\theta^4}},\ \{\theta,\ -13,\ 13\}\right]$$



We will now elaborate on the nature of r_1 in terms of constant rate, and then come back to the equations for r that we have found through the realization of its parameters and solve them for theta.

$$r_1\,\hat{}\,2 = \left(r\,\hat{}\,2 - \left(\frac{r^2\ (4\,\pi-\Theta)\ \Theta}{4\,\pi^2}\right)\hat{}\,2\right) = r\,\hat{}\,2 - \eta\,\hat{}\,2 \tag{71}$$

$$r_1 = \sqrt{}\,(r\,\hat{}\,2-\eta\,\hat{}\,2) = \sqrt{\left(\left(\frac{2\,\pi^{3/2}\,\sqrt{-\frac{\sqrt{(4\,\pi-\theta)\,\theta}}{\pi^3}+\frac{4\,\sqrt{(4\,\pi-\theta)\,\theta}}{\pi^2\,\theta}}}{\sqrt{16\,\pi^4-32\,\pi^3\,\theta+24\,\pi^2\,\theta^2-8\,\pi\,\theta^3+\theta^4}}\right)\hat{}\,2-\eta\,\hat{}\,2\right)} =$$

We will briefly show what the graph looks like when the speed of light is the constant rate at which something along the line of η is traveling, not η = c6θ = (r / 6 θ) (6 θ). In that case, r would equal η, but what about the fact that h changes through r_1 (the base of the cone)? We will instead propose to say that η travels not at any rate, but at the speed of light. Of course, it's also possible to theorize and propose that the cone travels up into the third dimension, η, at a rate equal to the first derivative of the equation for r in terms of theta with respect to theta. However, we will now briefly discuss what happens to r_1 when the cone travels

$$\eta\text{^}2=\frac{4\,\eta^2\,\pi^2}{4\,\pi\,\theta-\theta^2}$$

$$r_1\text{^}2=\left(r\text{^}2-\left(\frac{r^2\,(4\,\pi-\theta)\,\theta}{4\,\pi^2}\right)\text{^}2\right)$$

$$D[r,\theta] = r - r_1 = \frac{2\,h\,\pi}{\sqrt{4\,\pi\,\theta-\theta^2}} - \left(r\,\hat{}\,2 - \left(\frac{r^2\,(4\,\pi-\theta)\,\theta}{4\,\pi^2}\right)\hat{}\,2\right)$$

$$\frac{r^2\,(4\,\pi-\theta)\,\theta}{4\,\pi^2} = \eta\,\hat{}\,2;\quad \frac{2\,h\,\pi}{\sqrt{4\,\pi\,\theta-\theta^2}} = r$$

$$\eta = r\,/\,(6\,\theta) = r\,/\,t$$

$$\frac{4\,\eta^2\,\pi^2}{4\,\pi\,\theta-\theta^2} = r\,\hat{}\,2$$

$$\text{Solve}\left[\frac{r^2\,(4\,\pi-\theta)\,\theta}{4\,\pi^2} == r\,\hat{}\,2,\ \theta\right]$$

$$\{\{\theta \to 2\,\pi\},\ \{\theta \to 2\,\pi\}\}$$

$$\text{Solve}\left[\frac{r^2\,(4\,\pi-\theta)\,\theta}{4\,\pi^2} == (r\,/\,6\,\theta)\,\hat{}\,2,\ r\right]$$

$$\{\{r \to 0\},\ \{r \to 0\}\}$$

$$\text{Simplify}\left[\sqrt{\frac{r^2\,(4\,\pi-\theta)\,\theta}{4\,\pi^2}}\right]$$

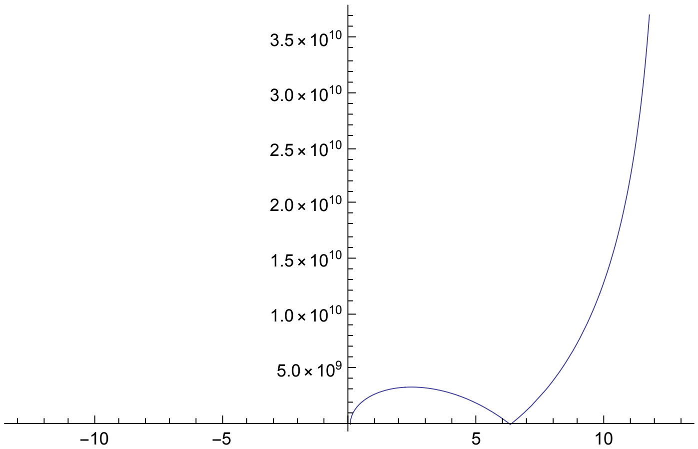
$$\frac{\sqrt{r^2\,(4\,\pi-\theta)\,\theta}}{2\,\pi}$$

For light, the equation would read :

$$r_1 = \sqrt{\left(\left(\frac{2\,(2.99792 * 10\,\hat{}\,8)\,(6)\,(\theta)\,\pi}{\sqrt{4\,\pi\,\theta-\theta^2}}\right)\hat{}\,2 - \left(\frac{\sqrt{\left(\frac{2\,(2.99792*10\hat{}8)\,(6)\,(\theta)\,\pi}{\sqrt{4\,\pi\,\theta-\theta^2}}\right)^2\,(4\,\pi-\theta)\,\theta}}{2\,\pi}\right)\hat{}\,2\right)}$$

$$\sqrt{\frac{1.27733\times10^{20}\,\theta^2}{4\,\pi\,\theta-\theta^2} - \frac{3.23551\times10^{18}\,(4\,\pi-\theta)\,\theta^3}{4\,\pi\,\theta-\theta^2}}$$

$$\text{Plot}\left[\sqrt{\frac{1.2773276589129854\grave{}*\hat{}20\,\theta^2}{4\pi\theta-\theta^2}-\frac{3.235508757504\grave{}*\hat{}18\,(4\pi-\theta)\,\theta^3}{4\pi\theta-\theta^2}},\{\theta,-13,13\}\right]$$



This is something much different from the quality of matter whose energetic relation to velocity is defined within its own consistency.

Now we will return to the more general form of the equation. The case when h = (r/6 θ) (6 θ)

Now, by doing the first and second derivatives of the functions for radius in terms of the square of h being equal to the are of the cirle of r_1 with respect to time will give us velocity.

$$\left\{\{r\to 0\},\{r\to 0\},\left\{r\to-\frac{2\pi^{3/2}\sqrt{-\frac{\sqrt{(4\pi-\theta)\theta}}{\pi^3}+\frac{4\sqrt{(4\pi-\theta)\theta}}{\pi^2\theta}}}{\sqrt{16\pi^4-32\pi^3\theta+24\pi^2\theta^2-8\pi\theta^3+\theta^4}}\right\},\left\{r\to\frac{2\pi^{3/2}\sqrt{-\frac{\sqrt{(4\pi-\theta)\theta}}{\pi^3}+\frac{4\sqrt{(4\pi-\theta)\theta}}{\pi^2\theta}}}{\sqrt{16\pi^4-32\pi^3\theta+24\pi^2\theta^2-8\pi\theta^3+\theta^4}}\right\}\right\} \tag{72}$$

$$\frac{2\pi\sqrt{4\pi^2 - 4\pi\theta + \theta^2}}{\sqrt{16\pi^4 - 32\pi^3\theta + 24\pi^2\theta^2 - 8\pi\theta^3 + \theta^4}} = r$$

Alden Daniels :

"geometric interpretation where you see higher dimensions being generated through implicit tensions that somehow cause dimensions stretching to infinity, but in the process of having that in a limiting case, they are actually creating expansion of higher dimensions."

Impicit shape of consciousness relates to the genetic structure. Spin inherently generates motion.

The last 6 roots yielded no graph, and we are uncertain of the x intercept.

$$\text{Solve}\left[\frac{2\,(r\,/\,(6\,\theta))\,(6)\,(\theta)\,\pi}{\sqrt{4\,\pi\,\theta-\theta^2}}==r,\,\theta\right]$$

$\{\{\theta\to 2\,\pi\}\}$

$$\text{From}\ \pi\,r_1\text{^}2=\left(r\text{^}2-\eta\text{^}2\right)\text{^}2=\pi\left(r\text{^}2-\left(\frac{r^2\,(4\,\pi-\theta)\,\theta}{4\,\pi^2}\right)\right)\text{^}2=n\left(\frac{r^2\,(4\,\pi-\theta)\,\theta}{4\,\pi^2}\right)$$

$$\text{For},\ n=\frac{\sqrt{(4\,\pi-\theta)\,\theta}}{\pi\,\theta^2}$$

We say the general statement that :

$$\left\{\{r\to 0\},\ \{r\to 0\},\ \left\{r\to -\frac{2\,\pi^{3/2}\sqrt{-\frac{\sqrt{(4\,\pi-\theta)\,\theta}}{\pi^3}+\frac{4\,\sqrt{(4\,\pi-\theta)\,\theta}}{\pi^2\,\theta}}}{\sqrt{16\,\pi^4-32\,\pi^3\,\theta+24\,\pi^2\,\theta^2-8\,\pi\,\theta^3+\theta^4}}\right\},\right.$$

$$\left.\left\{r\to \frac{2\,\pi^{3/2}\sqrt{-\frac{\sqrt{(4\,\pi-\theta)\,\theta}}{\pi^3}+\frac{4\,\sqrt{(4\,\pi-\theta)\,\theta}}{\pi^2\,\theta}}}{\sqrt{16\,\pi^4-32\,\pi^3\,\theta+24\,\pi^2\,\theta^2-8\,\pi\,\theta^3+\theta^4}}\right\}\right\}$$

For n = 1, we say specifically that :

$$\mathbf{Solve}\left[\pi\left(r\,^\wedge 2-\left(\frac{r^2\,(4\,\pi-\theta)\,\theta}{4\,\pi^2}\right)\right)^\wedge 2==\left(\frac{r^2\,(4\,\pi-\theta)\,\theta}{4\,\pi^2}\right),\ r\right]$$

$$\left\{\{r\to 0\},\ \{r\to 0\},\ \left\{r\to -\frac{2\,\sqrt{\pi}\,\sqrt{4\,\pi\,\theta-\theta^2}}{\sqrt{16\,\pi^4-32\,\pi^3\,\theta+24\,\pi^2\,\theta^2-8\,\pi\,\theta^3+\theta^4}}\right\},\right.$$

$$\left.\left\{r\to \frac{2\,\sqrt{\pi}\,\sqrt{4\,\pi\,\theta-\theta^2}}{\sqrt{16\,\pi^4-32\,\pi^3\,\theta+24\,\pi^2\,\theta^2-8\,\pi\,\theta^3+\theta^4}}\right\}\right\}$$

So, we will now look at the velocity of our equations by taking their first derivative with respect to time.

$$\mathbf{D}\left[-\frac{2\,\pi^{3/2}\sqrt{-\frac{\sqrt{(4\,\pi-\theta)\,\theta}}{\pi^3}+\frac{4\,\sqrt{(4\,\pi-\theta)\,\theta}}{\pi^2\,\theta}}}{\sqrt{16\,\pi^4-32\,\pi^3\,\theta+24\,\pi^2\,\theta^2-8\,\pi\,\theta^3+\theta^4}},\ \theta\right]$$

$$\mathbf{Simplify}\left[-\frac{\pi^{3/2}\left(-\frac{4\,\pi-2\,\theta}{2\,\pi^3\,\sqrt{(4\,\pi-\theta)\,\theta}}+\frac{2\,(4\,\pi-2\,\theta)}{\pi^2\,\theta\,\sqrt{(4\,\pi-\theta)\,\theta}}-\frac{4\,\sqrt{(4\,\pi-\theta)\,\theta}}{\pi^2\,\theta^2}\right)}{\sqrt{16\,\pi^4-32\,\pi^3\,\theta+24\,\pi^2\,\theta^2-8\,\pi\,\theta^3+\theta^4}\,\sqrt{-\frac{\sqrt{(4\,\pi-\theta)\,\theta}}{\pi^3}+\frac{4\,\sqrt{(4\,\pi-\theta)\,\theta}}{\pi^2\,\theta}}}+\right.$$

$$\left.\frac{\pi^{3/2}\left(-32\,\pi^3+48\,\pi^2\,\theta-24\,\pi\,\theta^2+4\,\theta^3\right)\sqrt{-\frac{\sqrt{(4\,\pi-\theta)\,\theta}}{\pi^3}+\frac{4\,\sqrt{(4\,\pi-\theta)\,\theta}}{\pi^2\,\theta}}}{\left(16\,\pi^4-32\,\pi^3\,\theta+24\,\pi^2\,\theta^2-8\,\pi\,\theta^3+\theta^4\right)^{3/2}}\right]$$

$$\frac{\sqrt{\frac{((4\,\pi-\theta)\,\theta)^{3/2}}{\theta^2}}\left(4\,\pi^2-16\,\pi\,\theta+3\,\theta^2\right)}{\theta\,\sqrt{(-2\,\pi+\theta)^4}\left(8\,\pi^2-6\,\pi\,\theta+\theta^2\right)}$$

$$\mathbf{m}\,\frac{\sqrt{\frac{((4\,\pi-\theta)\,\theta)^{3/2}}{\theta^2}}\left(4\,\pi^2-16\,\pi\,\theta+3\,\theta^2\right)}{\theta\,\sqrt{(-2\,\pi+\theta)^4}\left(8\,\pi^2-6\,\pi\,\theta+\theta^2\right)}=\mathbf{momentum}=\mathbf{p}$$

We experience the mass of an object through its meaning and function. The shape of the cone and the equalities within the syntax of our system.

Perceptual Philosophy with William Edelglass

Parker Emmerson

Wednesday, September 16

I.From on the Soul by Aristotle

Aristotle is defining a perceivable difference for the relationship of ideas through systems of perception (the senses).To me, this project makes great sense, because when I think of the difference between sound and music, I feel like the sound is less permanent to my perception, whereas music is more structured and permanent.A sound leaves an impression, but can we really attempt to categorize something so infinitely dense like this impression by calling it a form?Within each sense, we can categorize qualities of the sense, however, the categories are a mixture of each other, and parameters may work better to discuss the elements of sense.I think of the object of sense, for example, sound, being like a well in time, just like a cup creates a well of space to hold a substance.When we perceive, we are giving something new to the system of the well, i.e.we are putting a “spoon” into the cup, and withdrawing meaning, by some sentient understanding of the material held within the well, be it waves created

by the spoon' s maker interacting with water or tasting rice and thinking of snow, because, "The senses perceive each other' s special objects incidentally; not because the percipient sense is this or that special sense, but because all form a unity." Aristotle, however, did lack an awareness of intuitive sensing, or sixth sense, i.e.the noticing of something uneasy or invisible.What is the difference between sense and vision for Aristotle, aside from pure sight due to physical stimuli?The difference between two ideas is indeed related to a mathematical description, although this allegory can be made loosely when it pertains to the perception of the properties of the meaning of ideas (structured by idea or inherent property).

II.From an Essay toward a New Theory of Vision by George Berkeley

Berkeley is refining his semantic differences between seeing and vision.Vision, to me, implies an entire accessible realm of being visionary, whereas seeing is more related to sight in particular.I think that light is necessary for sight, but vision is related to both the visual and auditory systems.Light creates a chemical reaction in the brain, but the mind can access the same neurological and chemical structures to bring about a vision without direct light stimulus to the eye.Berkeley provides an overview of perceptual theory, and provides an account of the connection between meaning of senses and development of structure for the interpretation of any sense.When Berkeley says, "Moreover it is evident that no idea which is not itself perceived can be the means of perceiving any other idea" I sincerely disagree.There is the idea of 0/1 and it is not perceived.Yet, it can be the means of perceiving 10, in the base 10 system.If Berkley' s argument held, then 1 would be the same as 10. For the system to be consistent, we must be talking about numbering the same kind of things, not different placement values.Also, I could think of the frying ice cube, and this idea is not perceived when the true ice cube is not something that can change at all, for it is a perfect cube, and when frying, would immediately melt, however it could be the means of perceiving boiling water.I think that the mind can generate new ideas through invention.When invention occurs, an idea arises that previously went unseen.This arising may indeed come from the collection and contributions of other ideas.However, if the new idea is truly new, it is thus greater than the illusion in which the idea rests and the sum of all its component ideas.Thus, it can only relate to the phenomenon, through a direct make - believe correlation.III.Thomas Reid, Powers of Man

One might have a notion and conception of an object and not be able to see it, because of its context.There is a difference between perceiving an object and a system.How does language influence perception?Can one only see visible structure?What does it mean to give the name of a word?Is the mathematical validity of measuring things to have a self evident axiom that depends on what we see, and can it be said to be true only insofar as it is true for what we see?When we discuss the God' s eye perspective, we mean that it is possible, or hypothetically plausible that we, the perceivers are actually being perceived by some other being, and thus the observer is being affected by the perception of the other.This, however, would mean that God sees humanity from outside, and creates paradox, and that the origin of all paradox would be greater than we can conceive.However, I disagree.For, God knows the liars from the truth tellers without having to ask them, without having to inquire into by observation their own statements.

IV.From The Philosophy of the Enlightenment

Cassirer first asks touches on the problem of whether a man, born blind, would be able to acquire the sense of sight.He notes that this problem allows us to ponder into whether or not perception produces the physical world.He raises issues of the mind' s being somehow involved in the perceivable world, and inquires what functions of the mind engage the relation of things to perceptions.A blind person may still have some idea or vision of geometry and mathematics without actually seeing the geometric structure.What perception of geometry would a blind person see?This idea relates loosely to Plato' s thought experiment in the cave."The idea of space is not, therefore, strictly speaking an element of sense consciousness but an expression of a process, which goes on in consciousness.Only the speed and regularity of this process cause us to overlook the intermediate stages in ordinary introspection and to anticipate the end of the process at the very start (Perception Edited by Robert Schwartz Page 33).Cassirer goes on to elaborate on other philosophers with ideas on spatiality.Spatiality is the only integration of the mass that is perceived, the time that is perceived, and the energy that is imprinted in the visual system.This is done by the giving act of inclusion through empathy and the informationally dense, expressively simple, being of truth.Can we then tie this to the perception of beauty existentially, or would that break down into objectivism?

V.Elements of Physiology by Johannes Muller

For Muller, each nerve has a particular quality of energy.He then denotes the energies of each nerve to relate to Aristotle' s categorical descriptions of sense.For me, Aristotle' s idea of category would need to be closer to the idea of enclosing quality of something in areas of parameters for phenomenal description.When I sense a strawberry, I taste it, feel it and see it.When I really experience a strawberry, all of these individual senses are combined.Thus, experience is a combination of "timbres" that have their workspace existent relationships accessible to the mind.Discussing the function of nerves in the delivery of sensation is helpful, because it allows us to differentiate ideas through the cognition of relationships.He outlines the physiological correlations between different kinds of sensations.How can this help us see the difference between sense and experience?

VI.Treatis on Physiological Optics by Helmholtz

Helmholtz proposes that phenomena regarding the visual system can be described by the use of analogy when things begin to look paradoxical.He takes into consideration the psychic faculties and suggests that the processing of the environment and its perceptual phenomena may occur through an unconscious working of analogy in the mind.I find this to be interesting and agreeable.It provides a humanist account through the recognition of biological factors regarding perceptual systems.VII.Principles of Gestalt Psychology

The facts of direct perception can be related intimately to observing and experiment.Koffka says that, "as a rule, things are what they look like" (BRP, 51).Why not just say, "things look like what

they are"?For, how can a table be seen when there is no table?Koffka introduces notions of proximal and distant, which he uses to conclude that one of two objects will only look larger than the other only if it is in the same vertical plane as the other when its retinal image is larger.The proximal stimulus allows us to see size.How does framing of the legs relatively decrease the efficacy of the retinal image in producing a depth perception?How does contour effect the perception of size when relating two objects in different perceivable planes of verticality?Recognition of an orthogonal plane of relational verticality that does not relate directly to the retinal image may be the method used for the visual system to make discernments of distance on the horizon.Is consciousness a concept and how does intentionality play into this?To observe creates an intention through cognition.Aristotle begins to try to categorize the meaning of sensation for perceptual systems of all types, "The term object of sense covers three kinds of objects, two kinds of which we call perceptible in themselves, while the remaining one is only incidentally perceptible.Of the first two kinds one consists of what is special to a single sense, the other of what is common to any and all of the senses" (De Anima, Bk II, 418 a 1 - 13).I.From The Senses Considered as Perceptual Systems, and The Ecological Approach to Visual Perception by James J.Gibson

Objects are given the ability to be able to be conceived in some terms, but not other terms.-For Gibson, information given during sensation is the information delivered to the receptor.Gibson suggests that information exists in the world already, similar to Husserl' s idea of meaning.Experience is a relation of the information given in the world and the imaginary adulated mind synnaptically relating to the realness of the idea of mind through the existence of a complex perceptual system.Gibson believes that the phenomena can be perceptually understood in terms of the parameters by which they are measured.Can residual images effect the perception of depth or change it within the processing of information through being, imbuing a perception of one' s own character of being?When Gibson says, "in the case of a perceptual system, the input - output loop can be supposed to obtain information, actively" (BRP, 78), he relates perception to the information that is learned.How will the idea of a narrative relate to this assertion?"That province of the senses which is to "furnish us with a variety of sensations" is by no means the same as that which is to 'make us perceive'" (BRP 72).By this, Reid and Gibson believe that there is another element to perception other than the information being detected by a sensing organism.If a perception is to have being, it must be loved, thus there must be an element of persona to endow it with meaning and structure.A perception exists in terms of true and only true, for when the senses go from relative rest to motion, the processes include acceleration, which is also in terms of only true, and exists only more complexly in terms of variable time.Each of these informational points of perceptual space, for Gibson, is containing a means by which the information contained within it can be understood purely in terms of actuality of the presence of a perceptual object or object of sense.The measurability of a threshold presents an interesting semantic conundrum.Threshold could mean many things."Stimulus energy varies along simple dimensions like intensity and frequency, but stimulus information varies along innumberable complex dimensions, not all amenable to physical measurement." With this idea, Gibson differentiates between the more objective elements of stimulus and the more subjective ones.However, isn' t all of the information readily available to me?The variants of energy flux at a particular receptor can be described by a grid of Boolean operators

that relate our perception of the true in our world and the actual space through which it delivers the awareness.From the Evolving Brain by R.Grant Steen, we can notice that, “the memory of a particular place is encoded in just one place cell.” It may be possible that when measuring objects in our environment, that the determination of their location through perceptual systems hinges on a single variable.The true stimuli of the world and receptor are not dependent on the actuality of anything’ s presence until a perception is founded from corroborating perceptions within definitions of concrete being.It can be shown that the easily measured variables of stimulus energy, the intensity of light, sound, odor, and touch, for example, vary from place to place and from time to time as the individual goes about his business in the environment” (BRP 73).I disagree strongly, and in fact, there is no variation in time past the first derivative of distance.II.From In and Out of the Black Box by David W.Hamlyn

What kind of a sensation is he talking about?Hamlyn is questioning the actual occurrence of perceptions.He says that sensuous elements of perception like touch allow for a vocabulary of sensation.I think sensations happen through response, but can be really expressed and introspected upon through logical statements of propositions and equalities.Hamlyn also touches on the issue of whether or not visual experience is required for perception, taking the position that sight is not required for perception, but vision is.He tries to limit the meaning of the word vision to the realm of seeing with the eyes by referring to the term seeing when discussing the lack of consciousness when there is no sensory aspect to the experience of light on the eyes.There is a sense and inference of space due to cognitive processing of complex perceptual systems.“To the extent that we are aware thereby of texture of the surface, the less are we likely to be aware of the sensations” (BPR 81).This sounds somewhat like the probability of finding a cat dead inside a box with a uranium death trigger.Perceptual space differs from physical space in that in physical space, there is never an occasion for infinity of weight, but with perceptual space, a single object of perception can take utmost, infinite priority during a given situation.Coming to awareness of an actual texture through physical sensation of touch requires that we abandon awareness of the sensations.When we are able to describe our sensational awareness’ s being true, we are less likely to be aware of these as exact specific sensations.The forms of spatial perception proper are dependent on the information in light that is more easily specified to an exact location with relation to the environment than when the form itself is more general without any qualities of light able to fixed to their structure.III.From Perception and Cognition by John Heil

Heil begins proposing his theory by giving the layout of a theory he wishes to denounce in part, if not entirely.This account, which he rejects, is the account of sensory modalities by Grice.He says that theories that are based in the use of modalities for pinpointing the characteristics of sensation are, “burdened with two major, and a host of minor liabilities” (BRP 89).These theories are ones that he argues are based on an inner evidence, or, an “internal feature” (BPR 89).One of these is that they are hard pressed to find a series of components to perceptual experiences that designate a perception.I think that neuroscience has made progress doing this by analyzing the brain, but I’ m sure that the same areas of the brain can be involved in multiple perceptual experiences.The other major “pitfall” is that all individuals do not perceive the world exactly the same.I do think that modes are relevant to discussing the perceptual system, but I think that they are general categories of linguistic expression

for stimuli, and do not capture the entire essence of the perceptual symphony.For instance, analogously, modalities of the physical stimuli of sound do not encompass all of the possible tonality.Heil acknowledges a character to senses and goes on to say that sensatory modalities are the physical characteristic of the stimuli, not some inner - workings of the mind to interpret information provided like, “features we become aware of by means of them” (BRP 88).Perception, I am presently convinced, can be afforded by a mind interpreting its physical surroundings.Heil is expanding the act of seeing to include any detection of the physical environment by an individual by the perceptual system due to the sense of light.How would a T - perceiver respond to visual illusions?IV.From The Will by Brian O’ Shaughnessy

O’ Shaughnessy presents an account of sense that comes from awareness.Are we made aware of depth by inference?Awareness is a cognitive process, but also a potentially inferential one.When we are aware of space, we are also aware of material, time, and energy.Is there a sense that exists through the awareness of one of these in terms of any of the other three that can be said to infer an absence and a presence?The author’ s project is to examine the will of the body and its relation to perceptual sensation.O’ Shaughnessy would like to allow for the recognition that sensation occurs during the aftereffect of light or physical stimuli, not just during their immediate presence.Does O’ Shaughnessy think that motions of the perceptual system are psychological?He talks about depth perception of a monocular system.A depth perception for a monocular visual experience requires multiple, sequential observations in which physical stimulus to the eye gives information to bring about awareness of the characteristics of the environment’ s actuality.When the author talks about hallucination, I cannot follow his logic entirely, for when he says, “For a mental image is a seeming seeing, but not in the sense of being the same experience as seeing” (BPR 107), isn’ t it that a hallucination is the belief in an actual presence, and a is belief related to the perception of the world insofar as we can rely on the visual system?The afterimage is a reality in so far as it takes up space in the mind and this space is translated into a characteristic informative experience through embodied mind’ s culminating vision of mind by anthropomorphic tendencies and the relinquishing of them into pure information.This resembles Gibson’ s input - output loop.V.From The Analysis of Sensation by Ernst Mach

Mach begins by verifying a belief in the space - sense, an area of parameterized space relating the sense of an individual to the stimulus in the world.The space - sense provides a workspace for the individual senses like sense of sight and touch to enable a perceptual experience.“The perception of Depth depends on extra - occular experiences” (BRP 118) is an idea that makes a great deal of sense to me, because when we experience or perceive truth, we use multiple faculties to make sense of a phenomenon.VI.From Molyneux’ s Question by Michael J.Morgan

Morgan introduces the discussion with a discussion of Berkeley’ s theory, which, from the interpretation of it by G.M.Stratton, suggested that inverted perception created by wearing a set of prismatic glasses would eventually go back to normal for the perceiver.Merleau - Ponty provides a description of what the experience is like.Merleau - Ponty reports that the vision changed gradually, but sounds were

still hard to place unless the object was identified.Morgan suggests that the experiment concludes that, “perceptual space is not at all like the space of the physicist, an indifferent, isomorphic three - dimensional manifold, in which objects are situated sensible to feeling as to sight, and in which things are the same no matter how oriented” (BRP 121).When we experience the world, the laws of physics are evident and consequential.The theories and propositions that pertain to the delivery of the meaning and stimulus in and due to the physical reality are equally valid when finding analogies to decipher meaning from the world for the pursuit of happiness, eternality, and knowledge.VII.Molyneux’ s Question by Gareth Evans

If the man can eventually come to perceive relationships mathematically and gain enough knowledge through time, accustoming to the new perception of angles through sight, the answer is yes.It would be painful and hard, but plausible.A blind person can hear an amp and feel it at the same time.I think that Berkeley would be mistaken when thinking that touch could not have the same textural sense as sound.For Berkeley, sound and touch must occupy different areas of space - sense.If the blind man sees four dots, he can recognize the idea of four corners, which is in his database of prior experience.Vision with the eyes is a more immediate experience than perception with touch (feeling takes time), but that does not mean that the concept of the space taken up by a square cannot be conceived by a blind person and translated into mathematical language, then reapplied in a new method of perceiving the environment.Evans thinks that the notion of similarity will not apply.I agree, but I do think that the notion of realization could happen through a recognition of the parameters of the object with the newly acquired sensation.The conclusion would lead to the idea of language’ s being a super - structure to the mind.We can tell a lot about something just by seeing it.

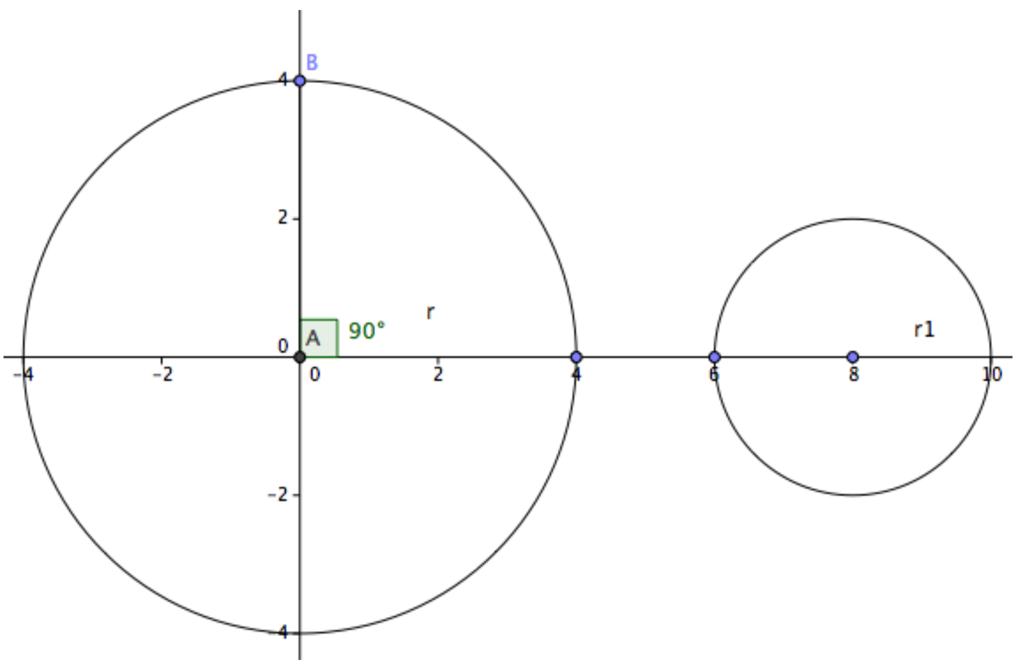
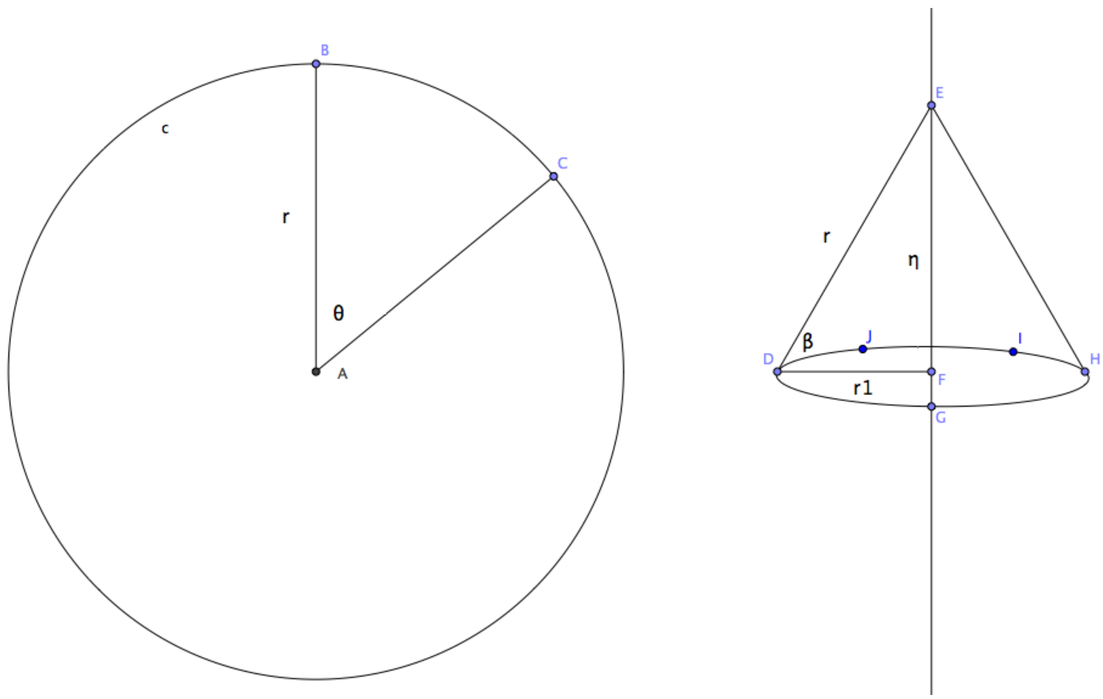
I. Math for Transforming a Circle into a Cone (The First Three Theorems)

by Parker Emmerson





When a sector of a circle is removed, we may "fold up" the resulting shape into a cone. The parameters are related by the following theorem :

Theorem 1 *When a sector of angle θ is removed from a circle of radius r and the resulting shape is folded into a cone, then the base of the cone has radius r_1 given by $r_1 = r - \frac{(r\theta)}{2\pi}$; and height η, given by $\eta = \sqrt{r^2 - r_1^2}$* = r Sin[$\beta$]

Proof. The circumference of the initial circle is 2π r and the wedge removed has an arc length r θ. Therefore, the remaining circumference is of length r $(2\pi - \theta)$, and after the fold, this is the circumference of the base of the cone.

Establishing the circumference of the base of the cone, from the equation, $\theta\, r = 2\pi\, r - 2\pi\, r_1$, we calculate that its radius r_1 is $\frac{2\pi r - r\theta}{2\pi}$, which simplifies to r - $\frac{r\theta}{2\pi}$. Thus, we have proved the first part of the theorem.

To find the height of the cone, η, we apply the Pythagorean theorem to a right triangle formed between the apex of the cone, the center of the base, and a point on the circumference of the base. This gives $\eta = \sqrt{r^2 - r_1^2}$ = r Sin[β], where β is the angle formed by the slant of the cone and the base of the cone. The initial radius is always equal to the slant of the cone, and the height of the cone is always orthogonal to the center of the base of the cone.

Lemma 1 The height of the cone can be caluclated in terms of r and θ.

Proof.

$\theta\, r = 2\pi\, r - 2\pi\, r_1$

$\eta = \sqrt{r^2 - r_1^2}$

$\theta\, r = 2\pi\, r - 2\pi \sqrt{(r\hat{}2 - \eta\hat{}2)}$

Solving this equation we find that,

$$\left\{\left\{\eta \to -\frac{\sqrt{4\pi r^2 \theta - r^2 \theta^2}}{2\pi}\right\}, \left\{\eta \to \frac{\sqrt{4\pi r^2 \theta - r^2 \theta^2}}{2\pi}\right\}\right\}$$

Lemma 2 The angle θ can be calculated in terms of r and η.

Proof

$$\text{Solve}\left[\eta == \frac{\sqrt{4\,\pi\,r^2\,\theta - r^2\,\theta^2}}{2\,\pi}, \theta\right]$$

$$\left\{\left\{\theta \to \frac{2\,\pi\,\left(r^2 - \sqrt{r^4 - r^2\,\eta^2}\right)}{r^2}\right\}, \left\{\theta \to \frac{2\,\pi\,\left(r^2 + \sqrt{r^4 - r^2\,\eta^2}\right)}{r^2}\right\}\right\}$$

Lemma 3 The initial radius is a function of θ and η.

$$\text{Solve}\left[\frac{\sqrt{4\,\pi\,r^2\,\theta - r^2\,\theta^2}}{2\,\pi} == \eta, r\right]$$

$$\left\{\left\{r \to -\frac{2\,\pi\,\eta}{\sqrt{4\,\pi\,\theta - \theta^2}}\right\}, \left\{r \to \frac{2\,\pi\,\eta}{\sqrt{4\,\pi\,\theta - \theta^2}}\right\}\right\}$$

Lemma 4 *The height of the cone can be calculated in terms of only r and θ*, thus β is a function of θ alone.

Proof. Since we have shown that θ r = 2 π r - 2 π r_1 and $r_1 \to \sqrt{r^2 - \eta^2}$, we can substitute the expression for r_1, calculated from the Pythagorean theorem in terms of the height of the cone and the initial radius of the circle, into the expression for θ r in terms of the change in circumference of the initial circle to the circle that is the base of the cone into which the circle was transformed.

θ r = 2 π r - 2 π $\sqrt{(r\,^\wedge 2 - \eta\,^\wedge 2)}$, thus, $\eta = \frac{\sqrt{4\,\pi\,r^2\,\theta - r^2\,\theta^2}}{2\,\pi}$ = (r Sin[β]). From $\frac{2\,\pi\,\eta}{\sqrt{4\,\pi\,\theta - \theta^2}}$ = r, we note that: r = $\frac{2\,\pi\,r\,\text{Sin}[\beta]}{\sqrt{4\,\pi\,\theta - \theta^2}}$. So we solve the equation,

$$\text{Solve}\left[r == \frac{2\,\pi\,r\,\text{Sin}[\beta]}{\sqrt{4\,\pi\,\theta - \theta^2}}, \beta\right]$$

$$\left\{\left\{\beta \to \text{ArcSin}\left[\frac{\sqrt{(4\,\pi - \theta)\,\theta}}{2\,\pi}\right]\right\}\right\}$$

Lemma 5 *The height of the cone can be calculated in terms of only r and θ*, thus θ is a function of β alone.

Proof. Since we have shown that θ r = 2 π r - 2 π r_1 and $r_1 \to \sqrt{r^2 - \eta^2}$, we can substitute the expression for r_1, calculated from the Pythagorean theorem in terms of the height of the cone and the initial radius of the circle, into the expression for θ r in terms of the change in circumference of the initial circle to the circle that is the base of the cone into which the circle was transformed.

θ r = 2 π r - 2 π $\sqrt{(r\,^\wedge 2 - \eta\,^\wedge 2)}$, thus, $\eta = \frac{\sqrt{4\,\pi\,r^2\,\theta - r^2\,\theta^2}}{2\,\pi}$ = (r Sin[β]). From $\frac{2\,\pi\,\eta}{\sqrt{4\,\pi\,\theta - \theta^2}}$ = r, we note that: r = $\frac{2\,\pi\,r\,\text{Sin}[\beta]}{\sqrt{4\,\pi\,\theta - \theta^2}}$. So we solve the equation,

$$\text{Solve}\left[r == \frac{2\,\pi\,r\,\text{Sin}[\beta]}{\sqrt{4\,\pi\,\theta - \theta^2}}, \theta\right]$$

$$\left\{\left\{\theta \to 2\,\left(\pi - \sqrt{\pi^2 - \pi^2\,\text{Sin}[\beta]^2}\right)\right\}, \left\{\theta \to 2\,\left(\pi + \sqrt{\pi^2 - \pi^2\,\text{Sin}[\beta]^2}\right)\right\}\right\}$$

Lemma 6 The initial radius can be calculated purely in terms of the angle θ.

Proof. From Lemma 1, the height of the cone has been solved in terms of the transformation. That expression for the height divided by the initial radius is set equal to the sine of β. Solving that equation yields an expression for β that includes r. This expression for β is then set equal to the expression found from Lemma 5.

$$\text{Sin}[\beta] = \frac{\eta}{r} = \frac{\sqrt{4\,\pi\,r^2\,\theta - r^2\,\theta^2}}{r\,2\,\pi} = \frac{4\,\pi\,r^2\,\theta - r^2\,\theta^2}{4\,\pi^2\,r} = \frac{r\,(4\,\pi - \theta)\,\theta}{4\,\pi^2}$$

$$\beta \to \text{ArcSin}\left[\frac{4\,\pi\,r\,\theta - r\,\theta^2}{4\,\pi^2}\right] = \text{ArcSin}\left[\frac{\sqrt{(4\,\pi - \theta)\,\theta}}{2\,\pi}\right]$$

$$\text{Solve}\left[\text{ArcSin}\left[\frac{4\,\pi\,r\,\theta - r\,\theta^2}{4\,\pi^2}\right] == \text{ArcSin}\left[\frac{\sqrt{(4\,\pi-\theta)\,\theta}}{2\,\pi}\right],\ r\right]$$

$$\left\{\left\{r \to \frac{2\,\pi\,\sqrt{(4\,\pi-\theta)\,\theta}}{(4\,\pi-\theta)\,\theta}\right\}\right\}$$

Commentary of Lemma 6. Matt Ollis pointed out to me that my final lemma to this section cannot be proved through Euclidean geometry, reasoning that because a circle of any radius and any angle taken out of it can be made, this statement cannot be proven. I initially proposed that the initial radius is not dependent on theta, so how can it be shown that it is? In any sufficiently logical system (as pointed out by Kurt Gödel in his famous, first incompleteness theorem), there is always a statement that is true, but cannot be proven. This resolves the paradox of why this algebraic-geometric phenomenon takes place - Euclidean geometry and algebra are sufficiently logical systems, and I assert that Lemma 6 is true, but not provable by Euclidean geometry (the system to which this mathematics belongs).

A note about time passing like a clock.

The elapse of one unit of time, t, can be expressed by a constant function of the angle θ. The simplest expression is t (seconds) = $\frac{\theta}{2\pi}$; $\theta = k\,t$, where k is 2π, because one unit of time is equal to one revolution of θ through a circle. But what is so strange, is that at 2π, there is no angle, because the cone has totally collapsed into a distance orthogonal to the center of the base of the initial circle. But it's actually alright to measure time like this, because the intial radius can rotate 2π degrees and act as a signifier of a total revolution at the position of $\theta = 2\pi$.

Proof. θ r = 2 π r - 2 π (r - r t) yields $t = \frac{\theta}{2\pi}$.

Theorem 2 When we designate that a single unit of time passes per revolution of the angle through the total number of radians in a circle, instantaneous velocity through the distance of the height of the cone can be found by taking the first derivative of the expression for that distance, which is in terms of r and θ, with respect to t = $\frac{\theta}{2\pi}$. There is also a velocity through the height of the cone, which is equal to wavelength times frequency = $\lambda\, f = \frac{\eta}{\left(\frac{\theta}{(2\pi)}\right)}$ considered the average velocity through the height of the cone. Under the condition that one unit of time passes with one revolution of the circle, these two velocities are equal to each other at the position where a 30-60-90 triangle is formed between the apex, center of the base of the cone, and point on the circumference of the circle of the base of the cone.

Proof.

To prove this, we can substitute r Sin[β] for the height of the cone in the expression of velocity = ((2 π η)/θ) and find a real and two complex solutions for theta in terms of β , thus from Lemma 4, we can solve for β exactly.

$$\text{Instantaneous Velocity} = \frac{d\eta}{dt} = \frac{d\eta}{d\,\frac{\theta}{(2\,\pi)}} =$$

$$D\left[\frac{\sqrt{4\,\pi\,r^2\,\theta - r^2\,\theta^2}}{2\,\pi},\ t\right] = D\left[k\,\frac{\sqrt{4\,\pi\,r^2\,\theta - r^2\,\theta^2}}{2\,\pi},\ \theta\right] = D\left[2\,\pi\,\frac{\sqrt{4\,\pi\,r^2\,\theta - r^2\,\theta^2}}{2\,\pi},\ \theta\right] = \frac{4\,\pi\,r^2 - 2\,r^2\,\theta}{2\,\sqrt{4\,\pi\,r^2\,\theta - r^2\,\theta^2}}$$

$$\text{Average Velocity} = (\eta\,/\,(\theta\,/\,2\,\pi))$$

$$\text{Instantaneous Velocity} = \frac{4\,\pi\,r^2 - 2\,r^2\,\theta}{2\,\sqrt{4\,\pi\,r^2\,\theta - r^2\,\theta^2}} = \text{Average Velocity} = \frac{2\,\pi\,\eta}{\theta}$$

$$\text{Solve}\left[\frac{4\,\pi\,r^2 - 2\,r^2\,\theta}{2\,\sqrt{4\,\pi\,r^2\,\theta - r^2\,\theta^2}} == \frac{2\,\pi\,\eta}{\theta},\ \theta\right]$$

$$\left\{\left\{\theta \to \frac{4\pi}{3} + \frac{-4\pi^2 r^4 + 12\pi^2 r^2 \eta^2}{6\pi r^2 \left(r^6 - 18 r^4 \eta^2 + 3\sqrt{3}\sqrt{-r^{10}\eta^2 + 11 r^8 \eta^4 + r^6 \eta^6}\right)^{1/3}} - \frac{2\pi\left(r^6 - 18 r^4 \eta^2 + 3\sqrt{3}\sqrt{-r^{10}\eta^2 + 11 r^8 \eta^4 + r^6 \eta^6}\right)^{1/3}}{3 r^2}\right\},\right.$$

$$\left\{\theta \to \frac{4\pi}{3} - \frac{\left(1 + i\sqrt{3}\right)\left(-4\pi^2 r^4 + 12\pi^2 r^2 \eta^2\right)}{12\pi r^2 \left(r^6 - 18 r^4 \eta^2 + 3\sqrt{3}\sqrt{-r^{10}\eta^2 + 11 r^8 \eta^4 + r^6 \eta^6}\right)^{1/3}} + \frac{\left(1 - i\sqrt{3}\right)\pi\left(r^6 - 18 r^4 \eta^2 + 3\sqrt{3}\sqrt{-r^{10}\eta^2 + 11 r^8 \eta^4 + r^6 \eta^6}\right)^{1/3}}{3 r^2}\right\},$$

$$\left.\left\{\theta \to \frac{4\pi}{3} - \frac{\left(1 - i\sqrt{3}\right)\left(-4\pi^2 r^4 + 12\pi^2 r^2 \eta^2\right)}{12\pi r^2 \left(r^6 - 18 r^4 \eta^2 + 3\sqrt{3}\sqrt{-r^{10}\eta^2 + 11 r^8 \eta^4 + r^6 \eta^6}\right)^{1/3}} + \frac{\left(1 + i\sqrt{3}\right)\pi\left(r^6 - 18 r^4 \eta^2 + 3\sqrt{3}\sqrt{-r^{10}\eta^2 + 11 r^8 \eta^4 + r^6 \eta^6}\right)^{1/3}}{3 r^2}\right\}\right\}$$

$$\text{Solve}\left[\frac{k\left(4\pi r^2 - 2 r^2 \theta\right)}{4\pi\sqrt{4\pi r^2 \theta - r^2 \theta^2}} == \frac{k\, r\, \text{Sin}[\beta]}{\theta}, \theta\right]$$

$$\left\{\left\{\theta \to \frac{4\pi}{3} - \frac{-4\pi^2 + 12\pi^2 \text{Sin}[\beta]^2}{6\left(-\pi^3 + 18\pi^3 \text{Sin}[\beta]^2 + 3\sqrt{3}\sqrt{-\pi^6 \text{Sin}[\beta]^2 + 11\pi^6 \text{Sin}[\beta]^4 + \pi^6 \text{Sin}[\beta]^6}\right)^{1/3}} + \frac{2}{3}\left(-\pi^3 + 18\pi^3 \text{Sin}[\beta]^2 + 3\sqrt{3}\sqrt{-\pi^6 \text{Sin}[\beta]^2 + 11\pi^6 \text{Sin}[\beta]^4 + \pi^6 \text{Sin}[\beta]^6}\right)^{1/3}\right\},\right.$$

$$\left\{\theta \to \frac{4\pi}{3} + \frac{\left(1 + i\sqrt{3}\right)\left(-4\pi^2 + 12\pi^2 \text{Sin}[\beta]^2\right)}{12\left(-\pi^3 + 18\pi^3 \text{Sin}[\beta]^2 + 3\sqrt{3}\sqrt{-\pi^6 \text{Sin}[\beta]^2 + 11\pi^6 \text{Sin}[\beta]^4 + \pi^6 \text{Sin}[\beta]^6}\right)^{1/3}} - \frac{1}{3}\left(1 - i\sqrt{3}\right)\left(-\pi^3 + 18\pi^3 \text{Sin}[\beta]^2 + 3\sqrt{3}\sqrt{-\pi^6 \text{Sin}[\beta]^2 + 11\pi^6 \text{Sin}[\beta]^4 + \pi^6 \text{Sin}[\beta]^6}\right)^{1/3}\right\},$$

$$\left.\left\{\theta \to \frac{4\pi}{3} + \frac{\left(1 - i\sqrt{3}\right)\left(-4\pi^2 + 12\pi^2 \text{Sin}[\beta]^2\right)}{12\left(-\pi^3 + 18\pi^3 \text{Sin}[\beta]^2 + 3\sqrt{3}\sqrt{-\pi^6 \text{Sin}[\beta]^2 + 11\pi^6 \text{Sin}[\beta]^4 + \pi^6 \text{Sin}[\beta]^6}\right)^{1/3}} - \frac{1}{3}\left(1 + i\sqrt{3}\right)\left(-\pi^3 + 18\pi^3 \text{Sin}[\beta]^2 + 3\sqrt{3}\sqrt{-\pi^6 \text{Sin}[\beta]^2 + 11\pi^6 \text{Sin}[\beta]^4 + \pi^6 \text{Sin}[\beta]^6}\right)^{1/3}\right\}\right\}$$

The real solution for θ, solved from equating the instantaneous velocity to the average velocity, can be equated with the real solution for the expression for θ from Lemma 4 to yield an exact solution for β that tells us that when these solutions for theta are equal, a 30-60-90 triangle is formed between the azimuth of the cone, the point on the base of the cone and the center of the base of the cone.

$$\text{Solve}\left[\frac{4\pi}{3} - \frac{-4\pi^2 + 12\pi^2 \text{Sin}[\beta]^2}{6\left(-\pi^3 + 18\pi^3 \text{Sin}[\beta]^2 + 3\sqrt{3}\sqrt{-\pi^6 \text{Sin}[\beta]^2 + 11\pi^6 \text{Sin}[\beta]^4 + \pi^6 \text{Sin}[\beta]^6}\right)^{1/3}} + \frac{2}{3}\left(-\pi^3 + 18\pi^3 \text{Sin}[\beta]^2 + 3\sqrt{3}\sqrt{-\pi^6 \text{Sin}[\beta]^2 + 11\pi^6 \text{Sin}[\beta]^4 + \pi^6 \text{Sin}[\beta]^6}\right)^{1/3} == 2\left(\pi + \sqrt{\pi^2 - \pi^2 \text{Sin}[\beta]^2}\right), \beta\right]$$

$$\left\{\left\{\beta \to -\frac{\pi}{3}\right\}, \left\{\beta \to \frac{\pi}{3}\right\}\right\}$$

We know that the height of the cone is perpendicular to the center of the base of the cone, so this proves a 30-60-90 triangle, because the sum of the angles of the triangle must be 180 degrees or π radians.

Lemma 7 We can show that $\beta = \frac{\pi}{3}$, thus we can show that there are two solutions to θ at which this occurs.

Proof.

$$\text{ArcSin}\left[\frac{\sqrt{(4\pi - \theta)\,\theta}}{2\pi}\right] = \beta$$

$\texttt{Solve}\left[\texttt{ArcSin}\left[\frac{\sqrt{(4\pi-\theta)\,\theta}}{2\pi}\right] == \frac{\pi}{3}, \theta\right]$

$\{\{\theta \to \pi\}, \{\theta \to 3\pi\}\}$

Lemma 8 We can show can show that the position at which instantaneous rate of change of the height of the cone with respect to theta equals average rate of change of the height of the cone, 'per theta measure,' at

$$\left\{\left\{\beta \to -\texttt{ArcSin}\left[\frac{\sqrt{-4\pi^2\theta+4\pi\theta^2-\theta^3}}{2\pi\sqrt{-4\pi+\theta}}\right]\right\}, \left\{\beta \to \texttt{ArcSin}\left[\frac{\sqrt{-4\pi^2\theta+4\pi\theta^2-\theta^3}}{2\pi\sqrt{-4\pi+\theta}}\right]\right\}\right\}.$$

Proof.

$$\texttt{Solve}\left[\theta == \frac{4\pi}{3} - \frac{-4\pi^2+12\pi^2\,\texttt{Sin}[\beta]^2}{6\left(-\pi^3+18\pi^3\,\texttt{Sin}[\beta]^2+3\sqrt{3}\sqrt{-\pi^6\,\texttt{Sin}[\beta]^2+11\pi^6\,\texttt{Sin}[\beta]^4+\pi^6\,\texttt{Sin}[\beta]^6}\right)^{1/3}} + \frac{2}{3}\left(-\pi^3+18\pi^3\,\texttt{Sin}[\beta]^2+3\sqrt{3}\sqrt{-\pi^6\,\texttt{Sin}[\beta]^2+11\pi^6\,\texttt{Sin}[\beta]^4+\pi^6\,\texttt{Sin}[\beta]^6}\right)^{1/3}, \beta\right]$$

$$\left\{\left\{\beta \to -\texttt{ArcSin}\left[\frac{\sqrt{-4\pi^2\theta+4\pi\theta^2-\theta^3}}{2\pi\sqrt{-4\pi+\theta}}\right]\right\}, \left\{\beta \to \texttt{ArcSin}\left[\frac{\sqrt{-4\pi^2\theta+4\pi\theta^2-\theta^3}}{2\pi\sqrt{-4\pi+\theta}}\right]\right\}\right\}$$

Theorem 3 The "innate velocity," v, within the Lorentz transformation can be solved for in terms of the system of the circle transforming into a cone. If r is multiplied by the Lorenz transformation, then it measures the distance in the prime system, denoted by r '. If t ' equals $\frac{\left(\frac{\theta}{(2\pi)}\right)}{\sqrt{1-\left(\frac{v^2}{c^2}\right)}}$, then the quantity r $\theta = \theta$ ' r '. We are only dealing with algebraic forms and the solutions necessitated by them. Logical, algebraic, reasoning will be given why, when using the exact speed of light, 2.99792458 (10^8) meters per second, the units of the speed of light can be ignored for the purposes of calculation and computation. This theorem states that, although, normal algebra would require the speed of light as a quantity to cancel out, valid expressions for the solutions for the intrinsic velocity, v, can be found in terms of η, r, and θ, or θ and β, depending on the expression used for the height of the cone.

Proof.

$c = 2.99792458\,(10^8)$ meters per second

$$r' = r\sqrt{1-\frac{v^2}{c^2}}$$

$$t' = \frac{\left(\frac{\theta}{(2\pi)}\right)}{\sqrt{1-\left(\frac{v^2}{c^2}\right)}}$$

$t' = \frac{\theta'}{2\pi}$

$2\pi t' = \theta'$

$$\theta' = \frac{\theta}{\sqrt{1-\frac{v^2}{c^2}}}$$

Therefore,

$$r'*\theta' = \left(\frac{\theta}{\sqrt{1-\frac{v^2}{c^2}}}\right)\left(r\sqrt{1-\frac{v^2}{c^2}}\right)$$

$$\left(\frac{\theta}{\sqrt{1-\frac{v^2}{c^2}}}\right)\left(r\sqrt{1-\frac{v^2}{c^2}}\right) = r\,\theta$$

$$r'*\theta' = r\,\theta = 2\,\pi\,r - 2\,\pi\,r_1 = 2\,\pi\,r - 2\,\pi\,\sqrt{r\,\hat{}\,2-\eta\,\hat{}\,2}$$

$$\text{Solve}\left[r\,\theta == 2\,\pi\,r - 2\,\pi\,\sqrt{r\,\hat{}\,2-\eta\,\hat{}\,2},\ \eta\right]$$

$$\left\{\left\{\eta\to-\frac{\sqrt{4\,\pi\,r^2\,\theta-r^2\,\theta^2}}{2\,\pi}\right\},\ \left\{\eta\to\frac{\sqrt{4\,\pi\,r^2\,\theta-r^2\,\theta^2}}{2\,\pi}\right\}\right\}$$

$$\textbf{Solve}\left[r'\,\theta' == 2\,\pi\,r - 2\,\pi\,\sqrt{r\,\hat{}\,2-\eta\,\hat{}\,2},\ \eta\right]$$

$$\left\{\left\{\eta\to-\frac{\sqrt{r'}\ \sqrt{\theta'}\ \sqrt{4\,\pi\,r-r'\,\theta'}}{2\,\pi}\right\},\ \left\{\eta\to\frac{\sqrt{r'}\ \sqrt{\theta'}\ \sqrt{4\,\pi\,r-r'\,\theta'}}{2\,\pi}\right\}\right\}$$

The argument follows modus ponens, saying that, through commutation, $r'\,\theta' = \theta\,r$, therefore $\eta = \frac{\sqrt{r'}\ \sqrt{\theta'}\ \sqrt{4\,\pi\,r-r'\,\theta'}}{2\,\pi} = \frac{\sqrt{4\,\pi\,r^2\,\theta-r^2\,\theta^2}}{2\,\pi}$

$$\eta = \frac{\sqrt{r'}\ \sqrt{\theta'}\ \sqrt{4\,\pi\,r-r'\,\theta'}}{2\,\pi} = \frac{\sqrt{r\sqrt{1-\frac{v^2}{c^2}}}\ \sqrt{\frac{\theta}{\sqrt{1-\frac{v^2}{c^2}}}}\ \sqrt{4\,\pi\,r - r\sqrt{1-\frac{v^2}{c^2}}\ \frac{\theta}{\sqrt{1-\frac{v^2}{c^2}}}}}{2\,\pi} = \frac{\sqrt{r\,\theta}\ \sqrt{4\,\pi\,r-r\,\theta}}{2\,\pi}$$

where c is its numeric value of the speed of light, its units being shown to cancel out.

$$\frac{\sqrt{1-\frac{v^2}{(c\ (\text{meters}/\text{second}))^2}}}{\sqrt{1-\frac{v^2}{(c\ (\text{meters}/\text{second}))^2}}} == \sqrt{\frac{1-\frac{v^2}{(c\ (\text{meters}/\text{second}))^2}}{1-\frac{v^2}{(c\ (\text{meters}/\text{second}))^2}}} == \sqrt{\frac{1-\frac{v^2}{(c)^2}}{1-\frac{v^2}{(c)^2}}}$$

$$\textbf{Solve}\left[\sqrt{\frac{1-\frac{v^2}{(c\ (\text{meters}/\text{second}))^2}}{1-\frac{v^2}{(c\ (\text{meters}/\text{second}))^2}}} == \sqrt{\frac{1-\frac{v^2}{(c)^2}}{1-\frac{v^2}{(c)^2}}},\ \text{meters}\right]$$

$$\{\{\}\}$$

$$\textbf{Solve}\left[\sqrt{\frac{1-\frac{v^2}{(c\ (\text{meters}/\text{second}))^2}}{1-\frac{v^2}{(c\ (\text{meters}/\text{second}))^2}}} == \sqrt{\frac{1-\frac{v^2}{(c)^2}}{1-\frac{v^2}{(c)^2}}},\ \text{second}\right]$$

{}

Seconds cancel out.

$$\text{Solve}\left[\frac{\sqrt{r\,\sqrt{1-\frac{v^2}{(c\,(\text{meters}/\text{second}))^2}}}\ \sqrt{\frac{\theta}{\sqrt{1-\frac{v^2}{(c\,(\text{meters}/\text{second}))^2}}}}\ \sqrt{4\,\pi\,r-r\,\theta}}{2\,\pi} == \eta,\ c\right]$$

{}

The numeric c cancels out.

$$\text{Solve}\left[\frac{\sqrt{r\sqrt{1-\frac{v^2}{(c\ (\text{meters/second}))^2}}}\ \sqrt{\frac{\theta}{\sqrt{1-\frac{v^2}{(c\ (\text{meters/second}))^2}}}}\ \sqrt{4\pi r - r\theta}}{2\pi} == \eta,\ r\right]$$

$$\left\{\left\{r \to -\frac{2\pi\eta}{\sqrt{4\pi\theta-\theta^2}}\right\},\ \left\{r \to \frac{2\pi\eta}{\sqrt{4\pi\theta-\theta^2}}\right\}\right\}$$

Radius yields the result from Lemma 3.

$$\text{Solve}\left[\frac{\sqrt{r\sqrt{1-\frac{v^2}{(c\ (\text{meters/second}))^2}}}\ \sqrt{\frac{\theta}{\sqrt{1-\frac{v^2}{(c\ (\text{meters/second}))^2}}}}\ \sqrt{4\pi r - r\theta}}{2\pi} == \eta,\ v\right]$$

{}

Velocity cancels out.

$$\text{Solve}\left[\frac{\sqrt{r\sqrt{1-\frac{v^2}{(c)^2}}}\ \sqrt{\frac{\theta}{\sqrt{1-\frac{v^2}{(c)^2}}}}\ \sqrt{4\pi r - r\theta}}{2\pi} == \eta,\ v\right]$$

{}

Velocity cancels out. Everything *cancels out*. Only when using the exact speed of light in scientific notation can solutions to the innate velocity be found.

We set the speed of light equal to its numeric value for the purpose of making computations, dropping the units, because in the expression for the height of the cone, they would cancel out anyway. It should be noted that this is necessary for computing the function of the velocity and that the exact speed of light is to be used as well as that the numeric value of the speed of light has to be in the form of scientific notation in order to find results to this equation.

Theorem 3 Continued From the expression of the height of the cone of Lemma 1, with the Lorentz transformations implicitly expressed, we can solve for the velocity within the Lorenz coefficient in terms of the height of the cone, the initial radius, and the angle, θ when using the exact speed of light in scientific notation and only when it is its exact (or extremely closely approximated) value expressed in scientific notation.

Proof.

```
c := 2.99792458 * (10^8)
```

$$\text{Solve}\left[\frac{\sqrt{r\sqrt{1-\frac{(v)^2}{c^2}}}\ \sqrt{\frac{\theta}{\sqrt{1-\frac{(v)^2}{c^2}}}}\ \sqrt{4\pi r - r\theta}}{2\pi} == \eta,\ v\right]$$

$$\left\{\left\{v \to -\frac{1.\ \sqrt{3.54814\times10^{18}\,\eta^2 - 1.12941\times10^{18}\,r^2\,\theta + 8.98755\times10^{16}\,r^2\,\theta^2}}{\sqrt{39.4784\,\eta^2 - 12.5664\,r^2\,\theta + r^2\,\theta^2}}\right\},\right.$$

A Notational Language for Describing the Geometry of Space-Time

by Parker Emmerson

© October 14, 2009

I. Postulates, Structure

$C = 2\pi r$

This is the circumference of our initial circle of radius r

$C_2 = 2\pi r_1$

This is the circumference of our second circle,
the base of the cone, of radius r_1

$r\verb|^|2 = r_1\verb|^|2 + \eta\verb|^|2$

This is the initial radius squared expressed as the slant of
the cone in terms of the height of the cone, η, and the radius
of the base of the cone, r_1

$r = \sqrt{}(r_1\verb|^|2 + \eta\verb|^|2)$ (80)

$s = \theta r$

$s / \theta = r$

The arc length taken out of a circle at a given time is =

$t = C - C_2 = 2\pi r - 2\pi r_1 = \theta r$ → Equation 7

$r_1\verb|^|2 == r\verb|^|2 - \eta\verb|^|2$

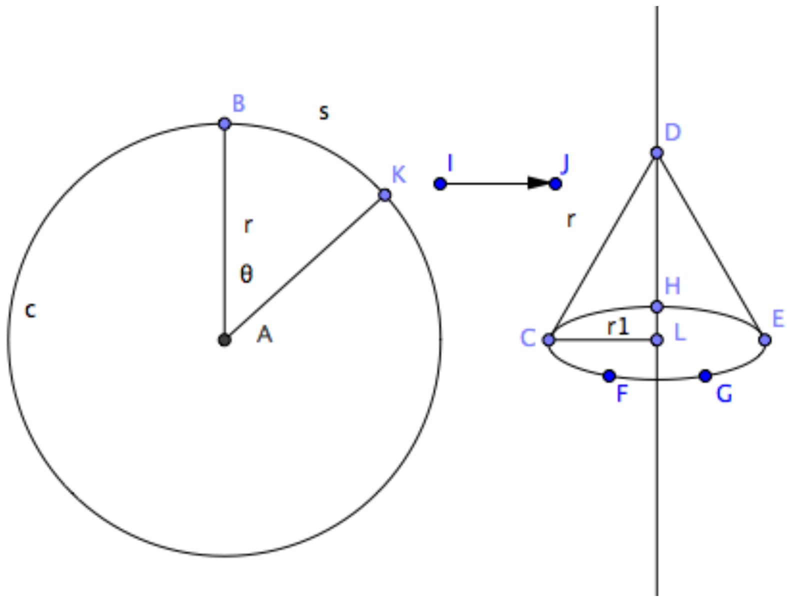
$r_1 = \sqrt{}(r\verb|^|2 - \eta\verb|^|2)$

$\eta \leq r$

$\tau = \text{time}$

1 second = 6 degrees

$\tau = 6\,\theta$



I will now do some algebra to conclude what the height of the cone is in terms of the initial parameters. It can eventually be reduced to a single variable.

Solve[r_1^2 + η^2 == r^2, η]

$$\left\{\left\{\eta \to -\sqrt{r^2 - r_1^2}\right\}, \left\{\eta \to \sqrt{r^2 - r_1^2}\right\}\right\} \quad (81)$$

We say that the amount of θr = s, taken out of the circle is the change in the circle's circumference that is the base of the cone. The change is equal to s = 2πr-2πr $_1$.

Notice that θ =
((2 π r) / r) - ((2 π r $_1$) / r), because we divide by r on both sides.

We will focus on the positive solutions for the height of the cone.

Solve[η == $\sqrt{r^2 - r_1^2}$, r_1]

$$\left\{\left\{r_1 \to -\sqrt{r^2 - \eta^2}\right\}, \left\{r_1 \to \sqrt{r^2 - \eta^2}\right\}\right\} \quad (82)$$

This is the change in circumference with
the substituted expression for r_1 in terms of h and r.

$$r\,\theta == s == 2\,\pi\,(r) - 2\,\pi\,\sqrt{((r)\,\hat{}\,2 - \eta\,\hat{}\,2)} = 2\,\pi\,(r) - 2\,\pi\,r_1 \quad (83)$$

θ == (2 π r) / r - (2 π r $_1$) / r) = ((2 π r) / r) - $\left(\left(2\,\pi\,\sqrt{-\eta^2 + r^2}\right) \Big/ r\right)$

Solve[θ * r == 2 π (r) - 2 π $\sqrt{((r)\,\hat{}\,2 - \eta\,\hat{}\,2)}$, η]

$$\left\{\left\{\eta \to -\frac{\sqrt{4\,\pi\,r^2\,\theta - r^2\,\theta^2}}{2\,\pi}\right\}, \left\{\eta \to \frac{\sqrt{4\,\pi\,r^2\,\theta - r^2\,\theta^2}}{2\,\pi}\right\}\right\} \quad (84)$$

$$\text{Solve}\left[\eta == \frac{\sqrt{4\pi r^2 \theta - r^2 \theta^2}}{2\pi}, r\right]$$

$$\left\{\left\{r \to -\frac{2\pi\eta}{\sqrt{4\pi\theta - \theta^2}}\right\}, \left\{r \to \frac{2\pi\eta}{\sqrt{4\pi\theta - \theta^2}}\right\}\right\} \quad (85)$$

II. Motion through the Space - Time

If there is something traveling over the distance, η , then its velocity is said to be the first derivative with respect to time. What if r is constant, which it is when it' s the hypoteneuse of the triangle made by the cone.

ν = frequency = 1 / τ = (1 / (1080 / π) θ) ,
because each second is in terms of degrees of a clock, and in terms of theta,
which is in radians, we must make the following conversion : (86)

$$\text{Time} = 6\,(\theta_{\text{degrees}}) = 6\,(180/\pi)\,\theta = (1080/\pi)\,\theta$$

$$\eta \to \frac{\sqrt{4\pi r^2 \theta - r^2 \theta^2}}{2\pi}$$

$$v = \lambda\,\nu = r\,(1/(1080/\pi)\,\theta) = ((1/(1080/\pi))\,D[\eta, \theta]) = 1/(1080/\pi))\ D\left[\frac{\sqrt{4\pi r^2 \theta - r^2 \theta^2}}{2\pi}, \theta\right] \quad (87)$$

The velocity of η is equal to the first derivative of η with respect to time. The constant (1/(1080/π)) is taken out of the equation in order to perform the derivative.

$$(1/(1080/\pi))\ D\left[\frac{\sqrt{4\pi r^2 \theta - r^2 \theta^2}}{2\pi}, \theta\right]$$

$$\frac{4\pi r^2 - 2 r^2 \theta}{4320\sqrt{4\pi r^2 \theta - r^2 \theta^2}}$$

$$\frac{4\pi r^2 - 2 r^2 \theta}{4320\sqrt{4\pi r^2 \theta - r^2 \theta^2}} =$$
velocity through the height of the cone when r is constant
(stays always the initial radius of the circle equal to the hypoteneuse
of the triangle formed by the height meeting the base of the cone) . (88)

$$\text{Solve}\left[\frac{4\pi r^2 - 2 r^2 \theta}{4320\sqrt{4\pi r^2 \theta - r^2 \theta^2}} == r\,(1/(1080/\pi)\,\theta), \theta\right]$$

$$\Bigg\{\Bigg\{\theta \to \pi - \frac{1}{2}\sqrt{\left(-\frac{1}{6\,\pi^2} + 4\,\pi^2 + \frac{\left(\frac{1}{2}\left(2 + 27\,648\,\pi^8 + \sqrt{110\,592\,\pi^8 + 764\,411\,904\,\pi^{16}}\right)\right)^{1/3}}{12\,\pi^2} + \frac{1}{6 \times 2^{2/3}\,\pi^2\left(2 + 27\,648\,\pi^8 + \sqrt{110\,592\,\pi^8 + 764\,411\,904\,\pi^{16}}\right)^{1/3}}\right)} -$$
